*Ontologically Controlled Autonomous Systems: Principles, Operations, and Architecture* George A. Fodor, 2013-11-27

Kevin M Passino When confronted with a control problem for complicated physical process a control engineer usually follows a predetermined design procedure This procedure often begins with the engineer seeking to understand the process and the primary control objectives A simple example of a control problem is an automobile cruise control that provides the automobile with the capability of regulating its own speed at a driver specified set point e g 55 mph One solution to the automotive cruise control problem involves adding an electronic controller that can sense the speed of the vehicle via the speedometer and actuate the throttle position so as to regulate the vehicle speed at the driver specified value Such speed regulation must be accurate even if there are road grade changes head winds or variations in the number of passengers in the automobile After gaining an intuitive understanding of the plant's dynamics and establishing the design objectives the control engineer typically solves the cruise control problem by using an established design procedure In particular this control engineering design methodology involves 1 Modeling understanding the plant 2 Construction of a controller to meet specifications such as stability rise time overshoot and steady state error 3 Analysis to make sure that the system will meet the performance objectives e g we might use mathematical simulation based or experimental analysis and 4 Iterating on the design until it is possible to commission the control system Ontologically Controlled Autonomous Systems George A. **Aspects of Soft Computing, Intelligent Robotics and Control** János Fodor, 2009-10-13 Soft computing as a collection of techniques exploiting approximation and tolerance for imprecision and uncertainty in traditionally intractable problems has become very effective and popular especially because of the synergy derived from its components The integration of constituent technologies provides complementary methods that allow developing flexible computing tools and solving complex problems A wide area of natural applications of soft computing techniques consists of the control of dynamic systems including robots Loosely speaking control can be understood as driving a process to attain a desired goal Intelligent control can be seen as an extension of this concept to include autonomous human like interactions of a machine with the environment Intelligent robots can be characterized by the ability to operate in an uncertain changing environment with the help of appropriate sensing They have the power to autonomously plan and execute motion sequences to achieve a goal specified by a human user without detailed instructions In this volume leading specialists address various theoretical and practical aspects in soft computing intelligent robotics and control The problems discussed are taken from fuzzy systems neural networks interactive evolutionary computation intelligent mobile robotics and intelligent control of linear and nonlinear dynamic systems Proceedings, IEEE Control Systems Society ...
