Operational Semantics For Timed Systems:

Operational Semantics for Timed Systems Heinrich Rust, 2005-03-31 This monograph is dedicated to a novel approach for uniform modelling of timed and hybrid systems Heinrich Rust presents a time model which allows for both the description of discrete time steps and continuous processes with a dense real number time model The proposed time model is well suited to express synchronicity of events in a real number time model as well as strict causality by using uniform discrete time steps Thus it integrates and reconciles two views of time that are commonly used separately in different application domains In many discrete systems time is modelled by discrete steps of uniform length in continuous systems time is seen as a dense flow The main idea to integrate these different views is a discretization of the dense real number time structure by using constant infinitesimal time steps within each real number point in time The underlying mathematical structure of this time model is based on concepts of Non standard Analysis as proposed by Abraham Robinson in the 1950s The discrete modelling i.e. the description of sequential discrete algorithms at different abstraction levels is done with Abstract State Machines along the formalisms developed by Yuri Gurevich and temporal logic These ingredients produce a rich formal basis for describing a large variety of systems with quantitative linear time properties by seamless integration refinement and embedding of continuous and discrete models into one uniform semantic framework called Non standard Timed Abstract State Machines NTASM

Model-Based Engineering of Embedded Real-Time Systems Holger Giese, Gabor Karsai, Edward A. Lee, Bernhard Rumpe, Bernhard Schätz, 2010-10-09 The topic of Model Based Engineering of Real Time Embedded Systems brings together a challenging problem domain real time embedded systems and a solution domain model based engineering It is also at the forefront of integrated software and systems engineering as software in this problem domain is an essential tool for system implementation and integration Today real time embedded software plays a crucial role in most advanced technical systems such as airplanes mobile phones and cars and has become the main driver and catalyst for innovation Development evolution verification configuration and maintenance of embedded and distributed software nowadays are often serious challenges as drastic increases in complexity can be observed in practice Model based engineering in general and model based software development in particular advocates the notion of using models throughout the development and life cycle of an engineered system Model based software engineering reinforces this notion by promoting models not only as the tool of abstraction but also as the tool for verification implementation testing and maintenance The application of such model based engineering techniques to embedded real time systems appears to be a good candidate to tackle some of the problems arising in the problem domain

Formal Techniques in Real-Time and Fault-Tolerant Systems Anders P. Ravn, Hans Rischel, 1998-09-02 This book constitutes the refereed proceedings of the 5th International Symposium on Formal Techniques in Real Time and Fault Tolerant Systems FTRTFT 98 held in Lyngby Denmark in September 1998 The 22 revised full papers presented were

carefully selected and reviewed for inclusion in the book Also included are four invited contributions and five tool demonstrations The papers address the current aspects of the hot topic of embedded systems in particular temporal logic requirements engineering analysis techniques verification model checking and applications

Formal Modeling and Analysis of Timed Systems Krishnendu Chatterjee, Thomas A. Henzinger, 2010-09-07 This volume contains the papers that were presented at the 8th International Conference on Formal Modeling and Analysis of Timed Systems FORMATS 2010 held September 8 10 2010 at IST Institute of Science and Technology Austria in Klosterneuburg Austria The modeling and analysis of timing aspects of systems is a key problem that has been treated independently in several different communities in computer science and related areas Researchers interested in semantics verification re time scheduling and performance analysis study modelssuch as timed automata and timed Petri nets the digital design community focuses on propagation and switching delays and designers of embedded controllers need to take into account the time required by controllers to compute their responses after sampling the environment Although the timing related questions in these separate communities have their own specific nature there is a growing awareness that there are basic problems that are common to all of them In particular all of these disciplines model and analyze systems whose behavior depends on combinations of logical and timing constraints between occurrences of events The aim of FORMATS is to promote the study of fundamental and practical aspects of timed systems and to bring together researchers from different disciplines that share an interest in the modeling and analysis of timed systems Typical topics include but are not limited to Foundations and Semantics theoretical foundations of timed systems and languages comparison between different models timed automata timed Petri nets hybrid automata timed process algebra max plus algebra probabilistic models

Formal Modeling and Analysis of Timed Systems Alessandro Abate, Gilles Geeraerts, 2017-09-01 This book constitutes the refereed proceedings of the 15th International Conference on Formal Modeling and Analysis of Timed Systems FORMATS 2017 held in Berlin Germany in September 2017 The aim of FORMATS is to promote the study of fundamental and practical aspects of timed systems and to bring together researchers from different disciplines that share interests in modelling and analysis of timed systems and as a generalization hybrid systems

issues involved in monitoring visualization and analysis methodology for verifying and debugging DRTSs It describes in detail how to overcome timing verification difficulties and improve system performance and reliability Complete with many carefully worked out examples as well as dozens of illustrations this timely and accessible work Explains real world debugging approaches proposed or tested using static analysis or dynamic analysis with or without monitoring Features step by step instructions for design implementation in hardware and software detecting timing errors and their causes graphical debugging methods and more Covers numerous analytical techniques including timed Petri nets temporal logic timed state transition systems timed process algebra and synchronous programming languages Makes distributed systems analysis accessible through examples such as a distributed telephone switching system and a fault tolerant distributed system Reviews many relevant professional papers and current research work The joint product of four leaders in the field Distributed Real Time Systems is an important text and reference for electrical and software engineers graduate students and anyone involved in computer and data processing technology *Fourth Euromicro Workshop on Real-Time Systems*, 1992 **Real-Time Systems Symposium, December 1-3, 1987, Fairmont Hotel, San Jose, California** IEEE Computer Society, 1987 Seventeenth IEEE Real-Time Systems Symposium, 1996 Encompassing both computer science and engineering aspects of real time systems the 31 papers cover scheduling experimental systems and applications formal methods synchronization models and tools communications databases timing analysis resource allocation and system implementation Among the specific topics are optimizing interprocess communications for embedded systems analyzing cache related preemption delay in fixed priority preemptive scheduling exploiting data semantics to schedule transactions with temporal constraints queuing theory message transmission with timing constraints in ring networks and approximate reachability analysis of times automata No subject index Annotation copyrighted by Book News Inc Portland OR

Fundamental Approaches to Software Engineering, 2000 *Introduction to the Formal Design of Real-Time Systems* David Gray, 1999 While the technology to build complex computer based systems now exists it is not always necessarily advisable to build them To use design tools effectively engineers need to have a full understanding not only of the capabilities of their tools but why they work and when their use is appropriate Richly illustrated with many examples and problem solving exercises this book looks at two process algebras one as a design tool for concurrent systems and one for real time systems 11th Euromicro Workshop on Real-Time Systems, 1999 **Fourth International Workshop on Real-Time Computing Systems and Applications** IEEE Computer Society, 1997 This text on distributed computing and real time systems includes the topics multimedia communications database fault tolerance timing analysis operating systems software systems and programming environments and scheduling **Real-time Systems** Krishna M. focusing on real time systems design and analysis Rather than focusing in theoretical observations of real time systems it is intended for the practical professional who is building real real time systems The editor himself the author of a course on real time systems has selected articles to provide a deep exploration of issues raised in his other works In particular emphasis is placed on applying practical but theoretically sound approaches in software engineering rate monotonic design and analysis testing and architecting systems for real time applications
