Origin And Early Evolution Of Life:

The Origin and Early Evolution of Life Tom Fenchel, 2002 *The Origin and Early Evolution of Life* draws on evidence from molecular genetics the structure and function of extant organisms and geology It covers the period from about 4 billion years ago when life is thought to have originated to about 600 million years ago when multicellular organisms first arose There are significant gaps in our understanding of the earliest evolution of life forms but an insight into the topic leads to a more profound understanding of life itself Particular emphasis is placed on the fact that although life arose very soon after the origin of the Earth it was represented only by simple microbial life forms for approximately 85% of this time Increase in complexity beyond the microbial level took place only very late in the history of life The Origin and Early Evolution of Life

The fields of interest encompassed by this quest are multiple and interdisciplinary: chemistry, physics, biology, biochemistry, mathematics, geology, but also statistics, atmospheric science, meteorology, oceanography, and astrophysics. Recent scientific discoveries such as water on Mars and the existence of super-Earths with atmospheres similar to primordial Earth have pushed researchers to simulate prebiotic conditions in explaining the abiotic formation of molecules essential to life. This collection of articles offers an overview of recent discoveries in the field of prebiotic chemistry of biomolecules, their formation and selection, and the evolution of complex chemical systems. The Origin and Early Evolution of Life Michele Fiore,Emiliano Altamura,2022-06-10 What is life How where and when did life arise These questions have remained most fascinating over the last hundred years Systems chemistry is the way to go to better understand this problem and to try and answer the unsolved question regarding the origin of Life Self organization thanks to the role of lipid boundaries made possible the rise of protocells The role of these boundaries is to separate and co locate micro environments and make them spatially distinct to protect and keep them at defined concentrations and to enable a multitude of often competing and interfering biochemical reactions to occur simultaneously The aim of this Special Issue is to summarize the latest discoveries in the field of the prebiotic chemistry of biomolecules self organization protocells and the origin of life In recent years thousands of excellent reviews and articles have appeared in the literature and some breakthroughs have already been achieved However a great deal of work remains to be carried out Beyond the borders of the traditional domains of scientific activity the multidisciplinary character of the present Special Issue leaves space for anyone to creatively contribute to any aspect of these and related relevant topics We hope that the presented works will be stimulating for a new generation of scientists that are taking their first steps in this fascinating field
