Multicomputer Vision:

Multicomputer Vision S. Levialdi, 1988-01-01 Multicomputer Vision is a collection of papers and discussions presented at the 8th Workshop on Multicomputers held in Rome Italy on June 2 5 1987 Contributors present multicomputer algorithms for image processing evaluation and suggestions on multicomputer systems and new designs in advanced architectures for computer vision Separating 12 papers into chapters this book first describes a pyramidal algorithm for image segmentation based on the definition of the bimean of a population It then examines the use of Polymorphic Torus architecture to yield positive results in the computation of Hough Transform through executing mesh and tree algorithms The succeeding papers present the five level quad tree pyramid algorithm based on chips from the MPP machine and the algorithm databases required for scheduling and reconfiguration decisions based on the user's task definition Other chapters oriented towards the evaluation of multicomputer systems are also provided These chapters include discussions on multi processor architectures based on perceptual tasks the advantages of fine grain associative string structure for general purpose computer vision system and the use of identical single processor elements for comparison between processor arrays and pipeline computers The book also contains papers oriented on the design features of new multiprocessor architectures These papers discuss the memory limitations of parallel machines and the physical realization of a one dimensional array of 128 to 1024 identical processors This book provides an informal frame of reference to researchers who are interested in the design and development of algorithms and architectures or languages of multiprocessor systems **Parallel Computer Vision**

Leonard Uhr, 2014-08-05 **Parallel Computer Vision** Morphological Image Processing: Architecture and VLSI design P.P. Jonker, 2012-12-06 Summary Based on the experiences of past designs and the outcome of recent studies in the comparisons of low level image processing architectures a pipelined system for real time low image processing has been designed and realized in CMOS technology To minimize design pitfalls a study was performed to the details of the design solutions that have been found in embodiments of the three main architectural groups of image processing the Square Processor Arrays the Linear Processor Arrays and the Pipelines This is reflected in a theoretical model As the design is based on bitplane wise processing of images research was performed on the principles of Cellular Logic Processing of two dimensional images of binary A methodology has been developed that is based on the transformation images using sets of Hit or Miss masks This method appeared to be extendable to higher dimensional images A theoretical model for the generation of break point conditions in high dimensional images has been developed and applied up to dimension three *Parallel Computer Vision* Leonard Uhr, 1987 *3D Computer Vision* Christian Wöhler, 2012-07-23 This indispensable text introduces the foundations of three dimensional computer vision and describes recent contributions to the field Fully revised and updated this much anticipated new edition reviews a range of triangulation based methods including linear and bundle adjustment based approaches to scene reconstruction and camera calibration stereo vision point cloud segmentation and pose estimation of

rigid articulated and flexible objects Also covered are intensity based techniques that evaluate the pixel grey values in the image to infer three dimensional scene structure and point spread function based approaches that exploit the effect of the optical system The text shows how methods which integrate these concepts are able to increase reconstruction accuracy and robustness describing applications in industrial quality inspection and metrology human robot interaction and remote sensing

Theoretical Foundations of Computer Vision Walter Kropatsch, Reinhard Klette, Franc Solina, R. Albrecht, 2012-12-06 Computer Vision is a rapidly growing field of research investigating computational and algorithmic issues associated with image acquisition processing and understanding It serves tasks like manipulation recognition mobility and communication in diverse application areas such as manufacturing robotics medicine security and virtual reality This volume contains a selection of papers devoted to theoretical foundations of computer vision covering a broad range of fields e g motion analysis discrete geometry computational aspects of vision processes models morphology invariance image compression 3D reconstruction of shape Several issues have been identified to be of essential interest to the community non linear operators the transition between continuous to discrete representations a new calculus of non orthogonal partially dependent systems

Computer Vision Li Fei-Fei, 2013-02-01 When a 3 dimensional world is projected onto a 2 dimensional image such as the human retina or a photograph reconstructing back the layout and contents of the real world becomes an ill posed problem that is extremely difficult to solve Humans possess the remarkable ability to navigate and understand the visual world by solving the inversion problem going from 2D to 3D Computer Vision seeks to imitate such abilities of humans to recognize objects navigate scenes reconstruct layouts and understand the geometric space and semantic meaning of the visual world These abilities are critical in many applications including robotics autonomous driving and exploration photo organization image or video retrieval and human computer interaction This book delivers a systematic overview of computer vision comparable to that presented in an advanced graduate level class The authors emphasize two key issues in modeling vision space and meaning and focus upon the main problems vision needs to solve including mapping out the 3D structure of objects and scenes recognizing objects segmenting objects recognizing meaning of scenes understanding movements of humans Motivated by these important problems and centered on the understanding of space and meaning the book explores the fundamental theories and important algorithms of computer vision starting from the analysis of 2D images and culminating in the holistic understanding of a 3D scene
