Multivariate Calibration Harald Martens, Tormod Næs, 1992-08-07 Multivariate Calibration Harald Martens Chemist Norwegian Food Research Institute Aas Norway and Norwegian Computing Center Oslo Norway Tormod Næs Statistician Norwegian Food Research Institute Aas Norway The aim of this interdisciplinary book is to present an up to date view of multivariate calibration of analytical instruments for use in research development and routine laboratory and process operation The book is intended to show practitioners in chemistry and technology how to extract the quantitative and understandable information embedded in non selective overwhelming and apparently useless measurements by multivariate data analysis Multivariate calibration is the process of learning how to combine data from several channels in order to overcome selectivity problems gain new insight and allow automatic outlier detection Multivariate calibration is the basis for the present success of high speed Near Infrared NIR diffuse spectroscopy of intact samples But the technique is very general it has shown similar advantages in for instance UV Vis and IR spectrophotometry transmittance reflectance and fluorescence for x ray diffraction NMR MS thermal analysis chromatography GC HPLC and for electrophoresis and image analysis tomography microscopy as well as other techniques The book is written at two levels the main level is structured as a tutorial on the practical use of multivariate calibration techniques It is intended for university courses and self study for chemists and technologists giving one complete and versatile approach based mainly on data compression methodology in self modelling PLS regression with considerations of experimental design data pre processing and model validation A second more methodological level is intended for statisticians and specialists in chemometrics It compares several alternative calibration methods validation approaches and ways to optimize the models The book also outlines some cognitive changes needed in analytical chemistry and suggests ways to overcome some communication problems between statistics and chemistry and technology

Insights Into Multivariate Calibration Using Errors-in-variables Modeling, 1996 A q vector of responses y is related to a p vector of explanatory variables x through a causal linear model In analytical chemistry y and x might represent the spectrum and associated set of constituent concentrations of a multicomponent sample which are related through Beer's law The model parameters are estimated during a calibration process in which both x and y are available for a number of observations samples specimens which are collectively referred to as the calibration set For new observations the fitted calibration model is then used as the basis for predicting the unknown values of the new x 's concentrations from the associated new y 's spectra in the prediction set This prediction procedure can be viewed as parameter estimation in an errors in variables EIV framework In addition to providing a basis for simultaneous inference about the new x 's consideration of the EIV framework yields a number of insights relating to the design and execution of calibration studies A particularly interesting result is that predictions of the new x 's for individual samples can be improved by using seemingly unrelated information contained in the y 's from the other members of the prediction set Furthermore motivated by this EIV analysis this result can be extended beyond the causal modeling context to a broader range of applications of multivariate calibration which involve the use of principal components regression

Multivariate Calibration of Classifier Scores Into Probability Space Martin Gebel, 2009-12 This book supplies a unifying framework for the derivation of probabilistic membership values in any classification task While statistical classifiers usually generate such probabilities which reflect the assessment uncertainty regularization methods supply membership values which do not induce any probabilistic confidence It is desirable to transform or re scale membership values to membership probabilities since they are comparable and easier applicable for post processing In this

book several univariate calibration methods are presented The methods are compared by their performance in experiments measured in terms of correctness and well calibration Multivariate extensions for regularization methods usually use a reduction to binary tasks followed by univariate calibration and further application of the pairwise coupling algorithm This book introduces a well performing alternative to coupling that generates Dirichlet distributed membership probabilities This flexible one step algorithm bases on probability theory and is applicable to all classification problems Dirichlet calibration method and pairwise coupling are compared in further experiments
