Multivariable Control System Design Techniques Dominance And Direct Methods:

Multivariable Control System Design Techniques G. F. Bryant, L. F. Yeung, 1996-07-25 Frequency domain based techniques are used for analysing and designing multivariable control systems The focus of this new book centres on two related concepts that of dominance and the application of ideas from direct methods of matrix inversion to the problems of multivariable and sequential design Written from a practical perspective the text highlights several sequential design ideas including Developments of a rigorous sequential design methodology and analysis based on Gauss Jordan concepts Presentation of frequency domain analogies of the direct methods of matrix inversion obtaining new and exact sequential design and stability results Discussion of procedures for obtaining and optimising dominance criteria including input output optimum assignment optimum scaling and the use of parameterised precompensators This detailed study written by two well known researchers in the field will greatly appeal to practising engineers in process control chemical and mechanical engineering Researchers concerned with systems design will also find this an invaluable reference source

Symbolic Methods in Control System Analysis and Design N. Munro, 1999 Fifteen contributions provide an up to date treatment of issues in system modeling system analysis design and synthesis methods and nonlinear systems Coverage includes the application of multidimensional Laplace transforms to the modeling of nonlinear elements a survey of customized computer algebra modeling programs for multibody dynamical systems robust control of linear systems using a new linear programming approach the development and testing of a new branch and bound algorithm for global optimization using symbolic algebra techniques and dynamic sliding mode control design using symbolic algebra tools

Computer Aided Control Systems Design 2000 (CACSD 2000) J. O. Gray, 2001 This Proceedings contains the papers presented at the 8th IFAC Symposium on Computer Aided Control Systems Design held at Salford UK on 11-13 September 2000 Modelling has emerged as a central issue here and industrial users require the development of modelling languages for both analyses and design as well as generic models and tools which can be used for system identification optimisation and fault diagnostics Linear lumped parameter systems of general complexity are currently well addressed by a range of commercially available packages However there is a dearth of tools suitable for the analysis and synthesis of large scale distributed non linear hybrid and stochastic systems which are increasingly a feature in modern manufacturing and process engineering As the scale of the problems to be addressed increases there is a need for numerically robust and efficient computational procedures linked to powerful interactive graphical interfaces which maximise the use of limited human resources and of course standardised data bases which can be used with wide range of analysis and design procedures Topics covered included the now traditional domains of algorithm architectures and tools and there was a very welcome emphasis on applications where no less than four sessions were devoted to this important aspect
