acoustic and electrochemical based biosensors biochips sensing recognition elements and biosensors for medical and environmental applications The papers presented at the conference represent basic and applied research studies in the fields of diagnostic assays and biosensor development Novel technologies such as arrays of sensors using high density fiber optics to sense labeled or unlabeled oligonucleotides and patterned arrays of recognition elements demonstrated the capability of biosensors to analyze multiple analytes

**Fisheries Processing** A.M. Martin, 2012-12-06

The fish processing industry is still far from the levels of scientific and technological development that characterize other food processing operations. It has also been slow in finding uses for by products and processing wastes compared with the meat and poultry industries. The utilization of fisheries by products or wastes constitutes an area in which the application of modern techniques could potentially improve profitability. At present increased attention is being focused on the application of new biotechnological methods to operations related to the seafood industry with the objective of increasing its general efficiency. Because fish processing operations are commonly carried out in the vicinity of the sea most of the resulting fish wastes have been disposed of by returning them to the sea. Pollution control measures and a better understanding of the valuable composition of the products extracted from the sea are expected to encourage their recovery and the development of new products from them. In the past fisheries wastes and species not used for food have been generally utilized through technological processes with a low level of sophistication such as those for the production of animal feed and fertilizer. Limited economic success has accompanied the application of physical and chemical processes for the recovery of non utilized fisheries biomass and for the production of quality products from them

Hui, 2008-02-28 Food diagnostics is a relatively new and emerging area fuelled in large part by the ever increasing demand for food safety. Advances in Food Diagnostics provides the most updated comprehensive professional reference source available covering sophisticated diagnostic technology for the food industry. Editors Nollet, Toldrá and Hui and their broad team of international contributors address the most recent advances in food diagnostics through multiple approaches reviewing novel technologies to evaluate fresh products, describing and analyzing in depth several specific modern diagnostics, providing an analysis of data processing and discussing global marketing with an insight into future trends. While covering conventional typically lab based methods of analysis the book focuses on leading edge technologies that are being or about to be introduced. The book looks at areas such as food quality assurance, safety and traceability. Issues such as improved quality control, monitoring pesticide and herbicide residues in food, determining the nutritional content of food and distinguishing between GM and conventional foodstuffs are covered. Advances in Food Diagnostics offers the food professional what its title promises.
