Symposium on Analytical Colorimetry and Photometry Sponsored by A.S.T.M. Committees E-2 and E-3 American Society for Testing Materials, 1944 Activation Analysis, 1972 New Trends In Analytical, Environmental And Cultural Heritage Chemistry Lorenzo Tassi, 2008-01-01 This volume is intended to provide a general overview of principles and practical applications of various areas of analytical chemistry in particular but not exclusively in the contexts of environmental and cultural heritages conservation It is only since the 80 s that the production of more sensible recording instruments the miniaturization of analytical devices and the huge growth of computational power have become widely accessible and diffused for routine investigations Recent advances in the use and applications of uncommon techniques and relevant working methodologies e g synchrotron radiation will probably exert a permanent influence in future studies The development of hardware and software has awakened the interest in exploration of huge datasets e g instrumental signals and images and nowadays is an irreplaceable tool in defining correlations between objects systems mathematical variables and so on The result has been a great proliferation of research studies and applications in all the fields so that the Analytical

Chemistry has acquired a major status in the broad area of Applied Sciences. In fact in all of these great developments the analytical chemists have played and still play a pivotal role. During the past three decades just the time that we have been active in research and teaching activities we had the fortunate and exclusive opportunity to assist to the quite general and spectacular transition from the macro branch to micro branch of the subject area. Thus we have the great responsibility towards the new generations of scientists to stimulate interests and to provide guidance about micro analytical chemistry both in lecturing and in research. It is our opinion that analytical chemistry has been the mainstay in every chemical career of the past and we believe that the rigid discipline of conducting micro analytical experiments is an essential part of the training of every new chemist. All around the world analytical chemistry is developing micro and ultra micro analysis systems to such an extent that it is impossible to see with the naked eye the minute samples sent in for analysis. These highly performing methodologies make possible micro sampling of materials and substrates both for destructive or not destructive analysis without causing perceptible deterioration of the object or the system under study. Obviously the acquisition of the best knowledge and competences about techniques and working methodologies by the analysts in manipulating micro samples are only the essential prerequisites in order to gain the best results while laboratory protocols and good laboratory practice must be perfectly attained during the operations. Probably these concepts are the leit motif of the entire book. We have assumed the responsibility for the general outline of the book. We hope to have successfully assembled an interesting and versatile mix of various ingredients such as people and machines, ideas and results, techniques and methodologies, experiments and theories, materials and simulated models, a true cocktail provided by different chemists acting in very different analytical fields. The book is formally divided into three sections covering topics about general aspects of analytical chemistry (chapters 1-5) whose key words should be traceability in chemical measurements, sequential injection analysis, NMR and HR MAS, electron transfer in pesticides, multivariate analysis of analytical signals, applications in the environmental context (chapters 6-8), specific arguments are microwave techniques for sample manipulation, thermal methods of analysis, continuous and semi continuous analytical methods in paleoclimatic studies, some applications in the cultural heritage and conservation studies (chapters 9-17), treating stone cleaning and conservation, colour measurement on paintings, MS and GC MS analytical procedures for painting analysis, salt weathering, synchrotron radiation and lasers, applications to cultural heritages, investigations of historical glasses and papers and more than this. In some cases this subdivision was artificially forced and therefore it was not rigidly followed. In fact some chapters for their not at all specific content could be placed everywhere along the chapter sequence disregarding the apparent pertinence and the actual location in one section. With this final aim in mind each contributor was requested to present the state of the art in his field by introducing and applying contemporary statements of topics that he considers relevant to his research field and for the editorial assignment. In the preliminary call and in the subsequent editorial coordination of this material the primary intent has been to avoid as much as

possible unnecessary overlapping of the various chapters Some chapters however have been written to provide an historical development and a survey of recent exciting advances Their particular aim is to outline the basic principles to illustrate such success in applicative studies as is possible with current methods and to indicate their potential scope and present limitations Accordingly there is no attempt to provide anything in the nature of an encyclopaedic coverage but rather after a general survey of analytical studies and applications each specialist or co authorship has emphasized what he regards as the essential bases and recent developments of his topics Finally the Editors wish to address their gratitude to the Authors of the chapters As in all works involving multiple authors a great deal of the success of the venture depends upon their cooperation as well as upon the prompt advising by publisher staff This book is no exception to these rules Authors contributions required much of their valuable time which they must have sparingly withdrawn from their research teaching and many other related activities Furthermore it was a particular pleasure for the Editors to be able to call upon recognized and reputed scientists and between them many young research postgraduate students as contributors As research fellows or former research fellows we are delighted to see their enthusiastic participation and their excellent research targets so that the book exhibits we hope a tastefully arrangement The efforts of these Authors should be commended A special thank is extended to Transworld Research Nertwork for its fine production of this series in Scientific Communication
