Modulation Transfer Function in Optical and Electro-optical Systems Glenn D. Optical Transfer Function of Imaging Systems Thomas Williams, 1998-12-23 The Optical Transfer Function of Imaging Systems deals extensively with the theoretical concept of the optical transfer function OTF its measurement and application to imaging devices The OTF is a mathematical entity describing how well the subject is transferred into an image via the lens The book focuses on the practical aspects of using and measuring the OTF It presents the background physics necessary to understand and assess the performance of the great proliferation of electro optical systems including image intensifiers video cameras and thermal imagers Assuming a senior undergraduate level of optics knowledge the book is suitable for graduate courses in optics electro optics and photographic science In addition it is a practical guide for systems designers who require a means of assessing and specifying the performance of imaging systems It is also of interest to physicists and engineers working in all areas of imaging Optics and Photonics. Klingman, 1971 **Direct Measurement of the Optical Modulation Transfer Function of Non-developed Emulsions** Glen C. Elie, 1977 A new procedure for measuring the MTF of non developed emulsions is discussed which uses a coherent energy source and interference system to produce sinusoidal fringes on a film sample The transmitted light is projected onto the scanning slit of a photomultiplier and its variations registered on a chart recorder Measurements are taken directly from

the traces of the irradiance distribution to calculate the optical part of the MTF of the sample This system does not require development of the film and is therefore free of the non linearities inherent in traditional test methods Results are obtained for Kodak Panatomic X Kodak High Contrast Copy and Kodalith Ortho Type 3 films and compared where possible to the MTF derived from standard techniques The MTF found from this study is that of the light distribution in the undeveloped emulsion layer while the conventional method gives the MTF of the developed film Adjacency effects in development cause the two methods to produce different results It is concluded that this system is capable of producing excellent results for some types of films Recommendations are made for improvement of the apparatus to render the procedure more universally suitable

Abstract Weighting for the Modulation Transfer Function Robert James Flenniken, NAVAL POSTGRADUATE SCHOOL MONTEREY CA., 1983 The effects of turbulence on the performance of imagers or on beam forming optical systems are well expressed by the optical transfer function OTF or its magnitude the modulation transfer function MTF It has been shown that the MTF can be expressed in terms of the Fried model by means of a single number the turbulence structure constants for optical index C_n to the 2nd power provided that a properly path weighted value is obtained Based on current theory the weighting needed in the path position weighted value of C_n to the 2nd power is a function of z/z_0 raised to the 5/3 power heavily emphasizing the region near the imaging system or beam forming optics It is the conclusion of this report that the path weighting function Z/z_0 raised to the 5/3 power is correct Author The Modulation Transfer Function Applied to Electrostatic Electron Optical Systems of Images Tubes Lawrence Allen Ezard, 1970 **The Optical Transfer Function** K.
