Modes Of Speciation:

Modes of Speciation Michael James Denham White, 1978 *Phylogenetics and Ecology* Paul Eggleton, Richard I. Vane-Wright, Linnean Society of London, 1994-11-10 The relationship between systematics and ecology has recently been invigorated and developed a long way from the old field of comparative biology This change has been two fold Advances in phylogenetic research have allowed explicit phylogenetic hypotheses to be constructed for a range of different groups of organisms and ecologists are now more aware that organism traits are influenced by the interaction of past and present This volume discusses the impact of these modern phylogenetic methods on ecology especially those using comparative methods Although unification of these areas has proved difficult a number of conclusions can be drawn from the text These include the need for a working bridge between evolutionary biologists using logic based cladistic methods and those using probability based statistical methods for care in the selection of tree types for comparative studies and for systematists to attempt to analyse ecologically important groups Comparative ecologists and systematists need to come together to develop these ideas further but this volume presents a very useful starting point for all those interested in systematics and ecology Biological Science Fundamentals and Systematics Alessandro Minelli, Giancarlo Contrafatto, 2009 History and Scope of the Biological Sciences History of Biology Characteristics of Living Beings Levels of Biotic Organization Population Species and Communities Philosophy of Biological Sciences *Annual Review of Ecology and Systematics* Richard F. Johnston, Peter W. Frank, Charles D. Michener, 1975 Introduction to Population Biology & Evolution Otto Thomas Solbrig, Dorothy J. Solbrig, 1979 *Endless Forms* Daniel J. Howard, Stewart H. Berlocher, 1998 Speciation is one of the great themes of evolutionary biology It is the process through which new species are born and diversity generated Yet for many years our understanding of the process consisted of little more than a perception that if populations are isolated geographically they will diverge genetically and may come to form new species This situation began to change in the 1960s as an increasing number of biologists challenged the exclusivity of allopatric speciation and began to probe more deeply into the actual process by which divergence occurs and reproductive isolation is acquired This focus on process led to many new insights but numerous questions remain and speciation is now one of the most dynamic areas of research in modern evolutionary biology This volume presents the newest research findings on speciation bringing readers up to day on species concepts modes of speciation and the nature of reproductive barriers It also discusses the forces that drive divergence of populations the genetic control of reproductive isolation and the role played by hybrid zones and hybridization in speciation **The Evolutionary Process** Verne Grant, 1985 Providing a clear and thorough review of the active field of organic evolution the author describes the processes that bring about evolutionary change and the factors that affect these processes He covers a broad range of subjects placing classical and recent research in perspective and clarifying current controversies Nature Sir Norman Lockyer, 1927 **Proceedings, American Philosophical Society (vol. 127, No. 6, 1983) , The**

American Naturalist, 1927 **Applications of Genetics to Arthropods of Biological Control Significance** Sudhir Karl Narang, 2018-01-10 Written by experts in the fields of insect pest genetics the genetics of biological control organisms and the application of biological control this book provides the first up to date summary of the genetic literature on the genetics of arthropod biological control agents It identifies successful programs and also gaps and needs in research research constraints and possible research approaches in this important field of pest control The power and applicability of new genetic and molecular biology methods have created new and exciting possibilities to greatly improve the effectiveness of traditional biological control programs This book provides essential information about the state of the art application of these new methods It explains how biological control procedures can be improved covers methods for selecting pesticide resistant strains of natural enemies and looks at methods for maintaining genetic diversity and quality control during the rearing of biological control agents in the laboratory The book also provides information regarding the application of powerful PCR methods for taxonomic identification of strains and species of biocontrol agents *Annual Review of Ecology and Systematics* Professor Department of Ecology and Evolutionary Biology Museum of Natural History Richard F Johnston, Richard F. Johnston, 1981 **Fitness Landscapes and the Origin of Species** Sergey Gavrilets, 2018-06-05 The origin of species has fascinated both biologists and the general public since the publication of Darwin's *Origin of Species* in 1859 Significant progress in understanding the process was achieved in the modern synthesis when Theodosius Dobzhansky Ernst Mayr and others reconciled Mendelian genetics with Darwin's natural selection Although evolutionary biologists have developed significant new theory and data about speciation in the years since the modern synthesis this book represents the first systematic attempt to summarize and generalize what mathematical models tell us about the dynamics of speciation *Fitness Landscapes and the Origin of Species* presents both an overview of the forty years of previous theoretical research and the author's new results Sergey Gavrilets uses a unified framework based on the notion of fitness landscapes introduced by Sewall Wright in 1932 generalizing this notion to explore the consequences of the huge dimensionality of fitness landscapes that correspond to biological systems In contrast to previous theoretical work which was based largely on numerical simulations Gavrilets develops simple mathematical models that allow for analytical investigation and clear interpretation in biological terms Covering controversial topics including sympatric speciation and the effects of sexual conflict on speciation this book builds for the first time a general quantitative theory for the origin of species

Evolutionary Theory Niles Eldredge, Telmo Pievani, Emanuele Serrelli, Ilya Temkin, 2016-09-23 The natural world is infinitely complex and hierarchically structured with smaller units forming the components of larger systems genes are components genomes cells are building blocks of tissues and organs individuals are members of populations which in turn are parts of species In the face of such awe inspiring complexity scientists need tools like the hierarchy theory of evolution which provides a theoretical framework and an interdisciplinary research program that aims to understand the way complex

biological systems work and evolve The multidisciplinary approach looks at the structure of the myriad intricate interactions across levels of organization that range from molecules to the biosphere Evolutionary Theory A Hierarchical Perspective provides an introduction to the theory which is currently driving a great deal of research in bioinformatics and evolutionary theory Written by a diverse and renowned group of contributors and edited by the founder of Hierachy Theory Niles Eldredge this work will help make transparent the fundamental patterns driving living sytems

Biology and Management of Coregonid Fishes, 2005 Małgorzata Jankun,2007 Coregonids whitefish vendace cisco etc are cold water adapted fishes common throughout the Holarctic in North America Europe and Asia They have evolved into a myriad of forms subspecies and species during and after the Pleistocene glaciations They are therefore rich subjects for the study of evolutionary problems Coregonids support important commercial subsistence and recreational fisheries and are the subject of significant aquaculture operations around the world Although coregonids are generally considered to be fairly adaptable to the pressures of exploitation they do appear to be sensitive to changing environmental conditions such as eutrophication and a number of populations and species have been extirpated usually by deteriorating environments coupled with the introduction of exotic species and by commercial exploitation This sizeable volume contains 40 peer reviewed contributions on current topics of coregonid research presented at the Ninth International Symposium on the Biology and Management of Coregonid Fishes held in August 2005 in Olsztyn Poland They cover all aspects of coregonid life and managment The contributions can be grouped into of five subject areas genetics and evolution biology life history and population dynamics invasive species fisheries in Europe and fisheries in North America

Hierarchical Evolutionary-Developmental Theory Carlos Ochoa,2025-06-23 This book introduces a new evolutionary model called Hierarchical Evolutionary Developmental Theory or H Evo Devo Theory This theory proposes that the organism s internal properties reflect entities that are highly integrated in developmental terms that evolve hierarchically In other words it attempts to demonstrate that developmental constraints operate at different scales producing distinct states of morphological stability reflected as subspecies species higher taxa and homologues all representing units of evolution In addition it reintroduces the concept of the organism in evolutionary biology supports a strictly macroevolutionary view and contemplates alternative evolutionary rates processes and mechanisms at different levels microevolution macroevolution megaevolution and modular evolution In short this book establishes a new synthesis between systematics morphology and evolution suggesting a significant shift in evolutionary thought The book comprises 1 A proposal for a new theory of evolution and systematics The H Evo Devo Theory reinterprets the concepts of subspecies species higher taxa and homologues proposing that the phylogenetic tree is built on a hierarchy of types developed from the top down in contrast to the

traditional bottom up approach 2 A novel hierarchical perspective that reveals the underlying mechanisms acting on the patterns of divergence stability and extinction of the units of evolution 3 A resolution to the ontological problem regarding units of evolution e g the reality of species and higher taxa 4 A historical narrative that focuses on the development of a hierarchy theory of evolution grounded in the type concept and the significance of an organism centered perspective 5 A challenge to traditional frameworks that have sought to establish hierarchies in an evolutionary context 6 A challenge to classical evolutionary statements such as gradualism punctuated equilibrium the extrapolationist premise and geographical models of speciation This book is written for those who feel that radical change is needed in evolutionary theory offering them a viable alternative

Paleobiology ,1983 Publishes original articles that emphasize biological or paleobiological processes and patterns including speciation extinction development of individuals and colonies natural selection evolution and patterns of variation abundance and distribution of organisms in space and time Papers concerning recent organisms and systems are also included if they aid in understanding the fossil record and the history of life
