Division of Colloid and Surface Chemistry,      *Physico-Chemical Phenomena in Thin Films and at Solid Surfaces* ,2007-06-07 The book is devoted to the consideration of the different processes taking place in thin films and at surfaces Since the most important physico chemical phenomena in such media are accompanied by the rearrangement of an intra and intermolecular coordinates and consequently a surrounding molecular ensemble the theory of radiationless multi vibrational transitions is used for its description The second part of the book considers the numerous surface phenomena And in the third part is described the preparation methods and characteristics of different types of thin films Both experimental and theoretical descriptions are represented Media rearrangement coupled with the reagent

transformation largely determines the absolute value and temperature dependence of the rate constants and other characteristics of the considered processes. These effects are described at the atomic or molecular level based on the multi phonon theory starting from the first pioneering studies through to contemporary studies. A number of questions are included at the end of many chapters to further reinforce the material presented. Unified approach to the description of numerous physico chemical phenomena in different materials. Based on the pioneering research work of the authors. Explanation of a variety of experimental observations. Material is presented at two levels of complexity for specialists and non specialists. Identifies existing and potential applications of the processes and phenomena. Includes questions at the end of some chapters to further reinforce the material discussed.

**Atomic and Molecular Processes in Fusion Edge Plasmas** R.K. Janev, 2013-06-29. This well illustrated resource provides vital cross section information for the atomic and molecular collision processes taking place in the boundary region of magnetically confined fusion plasmas and in other laboratory and astrophysical low temperature plasmas. The expertly assessed information in this noteworthy volume includes the most recent experimental and theoretical results presented in a convenient format. Coverage includes the processes of electron impact excitation and ionization of plasma edge atoms, electron ion recombination, dissociative collision processes involving electrons and much more.
