Er bringt Anwendungsbeispiele aus dem akademischen und dem industriellen Bereich um dem Leser eine Vorstellung von der Bedeutung dieser Techniken zu geben. Methoden zur Polymer Analyse mit Qualitätschecks und Auswertungsverfahren sowie aus den Bereichen Oberflächenanalyse und Mikroskopie bilden unterstellt durch anschauliche Abbildungen und Beispiele den Schwerpunkt des Buches.

In-situ Materials Characterization Alexander Ziegler, Heinz Graafsma, Xiao Feng Zhang, Joost W.M. Frenken, 2014-04-01 The behavior of nanoscale materials can change rapidly with time either because the environment changes rapidly or because the influence of the environment propagates quickly across the intrinsically small dimensions of nanoscale materials. Extremely fast time resolution studies using X rays, electrons, and neutrons are of very high interest to many researchers and is a fast evolving and interesting field for the study of dynamic processes. Therefore, in situ structural characterization and measurements of structure-property relationships covering several decades of length and time scales from atoms to millimeters and femtoseconds to hours with high spatial and temporal resolutions are crucially important to understand the synthesis and behavior of multidimensional materials. The techniques described in this book will permit access to the real time dynamics of materials surface processes and chemical and biological reactions at various time scales. This book provides an interdisciplinary reference for research using in situ techniques to capture the real time structural and property responses of materials to surrounding fields using electron optical and x-ray microscopies e.g. scanning transmission and low energy electron microscopy and scanning probe microscopy or in the scattering realm with x-ray neutron and electron diffraction.

Green, K.J. Kozaczek, C.O.

Ruud,2012-12-06 Traditionally the vast majority of materials characterization techniques have been destructive e g chemical compositional analysis metallographic determination of microstructure tensile test measurement of mechanical properties etc Also traditionally nondestructive techniques have been used almost exclusively for the detection of macroscopic defects mostly cracks in structures and devices which have already been constructed and have already been in service for an extended period of time Following these conventional nondestructive tests it has been common practice to use somewhat arbitrary accept reject criteria to decide whether or not the structure or device should be removed from service The present unfavorable status of a large segment of industry coupled with the desire to keep structures in service well past their original design life dramatically show that our traditional approaches must be drastically modified if we are to be able to meet future needs The role of nondestructive characterization of materials is changing and will continue to change dramatically It has become increasingly evident that it is both practical and cost effective to expand the role of nondestructive evaluation to include all aspects of materials production and application and to introduce it much earlier in the manufacturing cycle In fact the recovery of a large portion of industry from severe economic problems is dependent in part on the successful implementation of this expanded role
