In addition to the amount of nutrition available and its macronutrient composition within a diet there is emerging evidence highlighting important roles for the lesser studied micronutrients. Added to this complexity is the distinction between maternal and fetal nutrition and the impact the placenta plays in nutrient metabolism and overall nutrient supply to the fetus. Together these many variables contribute to placental development and function fetal growth and where placental fetal nutrition and growth is compromised through poor maternal diet and or diet induced alterations in placental metabolism the impact is dramatic and can lead to lifelong implications for the offspring. This Special Issue book aims to highlight research in many of these areas.
