Third Series** Library of Congress. Copyright Office,1979 [Associations between Reading and Mathematics: Genetic, Brain Imaging, Cognitive and Educational Perspectives](#) Sarit Ashkenazi,Orly Rubinsten,Bert De Smedt,2017-10-05 Converging evidence demonstrates a strong link between reading and mathematics multiple cognitive processes are shared between reading and mathematics including the representation and retrieval of symbolic information attention working memory and cognitive control Additionally multiple brain networks are involved in both math and reading and last common genetic factors might influence both reading and math Hence it comes as no surprise that there are meaningful associations between aspects of math and reading abilities Moreover comorbidity rates between math learning disabilities MD and reading disabilities RD are high up to 66% and prevalence rate of the comorbid condition is reported to be more common than the prevalence rate of isolated math learning disabilities Accordingly the goal of the research topic is to explore the underline mechanisms of this overlap between reading and math The research topic aims to include the following topics Genetics it has been found that both RD and MD are based on genetic factors and run in families Moreover math problem solving shares significant genetic overlap with general cognitive ability and reading decoding whereas math fluency shares significant genetic overlap with reading

fluency and general cognitive ability. Hence this topic will explore the shared and unique genetic risk factors to RD and MD. In addition to shared and unique genetic influence on reading and math, a neural perspective converging evidence from both structural and multiple functional imaging studies involving a wide range of numerical tasks points to the intraparietal sulcus (IPS) as a core region that involves quantity manipulation. However, several additional brain areas such as frontoparietal and temporoparietal areas were found to be involved in numerical tasks. Individuals with MD show deficits in a distributed set of brain regions that include the IPS, fusiform gyrus in posterior brain regions, and prefrontal cortex regions. Similarly, converging evidence indicate that the left hemisphere regions centered in the fusiform gyrus, temporoparietal cortex, and prefrontal cortex regions are strongly involved in typical reading and present lower activity, connectivity, or abnormal structure in RD. Thus, there is a meaningful neural overlap between reading and math. Hence, the authors can submit empirical studies on the role of several brain regions that are involved in math and reading commonality and diversity both in the typical and atypical development. Cognitive factors that play a role in mathematics and reading and comorbidity between RD and MD. There is a long-lasting debate whether MD and RD originate from unique cognitive mechanisms or not. Multiple cognitive processes are shared between reading and mathematics. Therefore, impairments in any one of domain general skills could conceivably play an important role in both pure and comorbid conditions. Moreover, it has been suggested that phonological processing has a significant role in some aspects of numerical processing such as retrieval of arithmetical facts. Education, it will be interesting to look at the effect of interventions that aim to improve reading such as phonological awareness and their transfer effect on improving mathematical processing. Alternatively, it will be good to test whether math interventions will improve reading.
