Mathematical Programming and Financial Objectives for Scheduling Projects Alf Kimms,2001-06-01

Handbook of Markov Decision Processes Eugene A. Feinberg,Adam Shwartz,2012-12-06 Eugene A Feinberg Adam Shwartz

This volume deals with the theory of Markov Decision Processes MDPs and their applications Each chapter was written by a leading expert in the re spective area The papers cover major research areas and methodologies and discuss open questions and future research directions The papers can be read independently with the basic notation and concepts ofSection 1 2 Most chap ters should be accessible by graduate or advanced undergraduate students in fields of operations research electrical engineering and computer science 1 1 AN OVERVIEW OF MARKOV DECISION PROCESSES The theory of Markov Decision Processes also known under several other names including sequential stochastic optimization discrete time stochastic control and stochastic dynamic programming studiessequential optimization ofdiscrete time stochastic systems The basic object is a discrete time stochas tic system whose transition mechanism can be controlled over time Each control policy defines the stochastic process and values of objective functions associated with this process The goal is to select a good control policy In real life decisions that humans and computers make on all levels usually have two types ofimpacts i they cost orsavetime money or other resources or they bring revenues as well as ii they have an impact on the future by influencing the dynamics In many situations decisions with the largest immediate profit may not be good in view offuture events MDPs model this paradigm and provide results on the structure and existence of good policies and on methods for their calculation

Consumer-Driven Demand and Operations Management Models Serguei Netessine,Christopher S.

Tang,2009-06-02 This important book is by top scholars in supply chain management revenue management and e commerce all of which are grounded in information technologies and consumer demand research The book looks at new selling techniques designed to reach the consumer

Resource Allocation in Project Management Christoph

Schwindt,2005-06-13 The book is devoted to structural issues algorithms and applications of resource allocation problems in project management Special emphasis is given to a unifying framework within which a large variety of project scheduling problems can be treated Those problems involve general temporal constraints among project activities different types of scarce resources and a broad class of regular and nonregular objective functions ranging from time based and financial to resource levelling functions The diversity of the models proposed allows for covering many features arising in scheduling applications beyond the field of project management such as short term production planning in the manufacturing or process industries

Project Selection Under Uncertainty Stylianos Kavadias,Christoph H. Loch,2012-12-06 Project Selection Under Uncertainty is the result of a five year research program on the selection of projects in New Product Development NPD Choosing the New Product Development portfolio is of critical importance in today s business environment The NPD portfolio has considerable strategic effect on the middle term success of a business This book takes a step in developing a theory that

addresses the need for quantitative prioritization criteria within the broader strategic context of the R D portfolios Its foundation lies in mathematical theory of resource constrained optimization with the goal to maximize quantitative returns The book seeks to broaden the portfolio discussion in two ways First simplified models appropriate for the data poor NPD context are developed which attempt to illuminate the structure of the choice problem and robust qualitative rules of thumb rather than detailed algorithmic decision support Such robust rules can be applied in the R D environment of poor data availability Second the annual portfolio review is not the only important choice in resource allocation In addition the book discusses how ideas might be pre screened as they emerge and how projects should be prioritized once they are funded and ongoing **Operations Research and Health Care** Margaret L. Brandeau,Francois Sainfort,William P.

Pierskalla,2006-04-04 In both rich and poor nations public resources for health care are inadequate to meet demand Policy makers and health care providers must determine how to provide the most effective health care to citizens using the limited resources that are available This chapter describes current and future challenges in the delivery of health care and outlines the role that operations research OR models can play in helping to solve those problems The chapter concludes with an overview of this book its intended audience the areas covered and a description of the subsequent chapters KEY WORDS Health care delivery Health care planning HEALTH CARE DELIVERY PROBLEMS AND CHALLENGES 3 1 1 WORLDWIDE HEALTH THE PAST 50 YEARS Human health has improved significantly in the last 50 years In 1950 global life expectancy was 46 years 1 That figure rose to 61 years by 1980 and to 67 years by 1998 2 Much of these gains occurred in low and middle income countries and were due in large part to improved nutrition and sanitation medical innovations and improvements in public health infrastructure **An Introduction to Project Modeling and Planning** Gündüz

Ulusoy,Öncü Hazır,2021-04-05 This textbook teaches the basic concepts and methods of project management but also explains how to convert them to useful results in practice Project management offers a promising working area for theoretical and practical applications and developing software and decision support systems DSS This book specifically focuses on project planning and control with an emphasis on mathematical modeling Models and algorithms establish a good starting point for students to study the relevant literature and support pursuing academic work in related fields The book provides an introduction to theoretical concepts and it also provides detailed explanations application examples and case studies that deal with real life problems The chapter topics include questions that underlie critical thinking interpretation analytics and making comparisons Learning outcomes are defined and the content of the book is structured following these goals Chapter 1 begins by introducing the basic concepts methods and processes of project management This Chapter constitutes the base for defining and modeling project management problems Chapter 2 explores the fundamentals of organizing and managing projects from an organization s perspective Issues related to project team formation the role of project managers and organization types are discussed Chapter 3 is devoted to project planning and network modeling of

projects covering fundamental concepts such as project scope Work Breakdown Structure WBS Organizational Breakdown Structure OBS Cost Breakdown Structure CBS project network modeling activity duration and cost estimating activity based costing ABC data and knowledge management Chapter 4 introduces deterministic scheduling models which can be used in constructing the time schedules Models employing time based and finance based objectives are introduced The CPM is covered The unconstrained version of maximizing Net Present Value NPV is also treated here together with the case of time dependent cash flows Chapter 5 focuses on the time cost trade off problem explaining how to reduce the duration of some of the activities and therefore reduce the project duration at the expense of additional costs This topic is addressed for both continuous and discrete cases Chapter 6 discusses models and methods of scheduling under uncertain activity durations PERT is introduced for minimizing the expected project duration and extended to the PERT Costing method for minimizing the expected project cost Simulation is presented as another approach for dealing with the uncertainty in activity durations and costs To demonstrate the use of the PERT a case study on constructing an earthquake resistant residential house is presented Classifications of resource and schedule types are given in Chapter 7 and exact and heuristic solution procedures for the single and multi mode resource constrained project scheduling problem RCPSP are presented The objective of maximizing NPV under resource constraints is addressed and the capital constrained project scheduling model is introduced In Chapter 8 resource leveling and further resource management problems are introduced Total adjustment cost and resource availability cost problems are introduced Various exact models are investigated A heuristic solution procedure for the resource leveling problem is presented in detail Also resource portfolio management policies and the resource portfolio management problem are discussed A case study on resource leveling dealing with the annual audit project of a major corporation is presented Project contract types and payment schedules constitute the topics of Chapter 9 Contracts are legal documents reflecting the results of some form of client contractor negotiations and sometimes of a bidding process which deserve closer attention Identification and allocation of risk in contracts project control issues disputes and resolution management are further topics covered in this Chapter A bidding model is presented to investigate client contractor negotiations and the bidding process from different aspects Chapter 10 focuses on processes and methods for project monitoring and control Earned Value Management is studied to measure the project performance throughout the life of a project and to estimate the expected project time and cost based on the current status of the project How to incorporate inflation into the analysis is presented In Chapter 11 qualitative and quantitative techniques including decision trees simulation and software applications are introduced Risk phases are defined and building a risk register is addressed An example risk breakdown structure is presented The design of risk management processes is introduced and risk response planning strategies are discussed At the end of the Chapter the quantitative risk analysis is demonstrated at the hand of a team discussion case study Chapter 12 covers several models and approaches dealing with various stochastic aspects of the

decision environment Stochastic models generation of robust schedules use of reactive and fuzzy approaches are presented Sensitivity and scenario analysis are introduced Also simulation analysis which is widely used to analyze the impacts of uncertainty on project goals is presented Chapter 13 addresses repetitive projects that involve the production or construction of similar units in batches such as railway cars or residential houses Particularly in the construction industry repetitive projects represent a large portion of the work accomplished in this sector of the economy A case study on the 50 km section of a motorway project is used for demonstrating the handling of repetitive project management How best to select one or more of a set of candidate projects to maintain a project portfolio is an important problem for project based organizations with limited resources The project selection problem is inherently a multi objective problem and is treated as such in Chapter 14 Several models and solution techniques are introduced A multi objective multi period project selection and scheduling model is presented A case study that addresses a project portfolio selection and scheduling problem for the construction of a set of dams in a region is presented Finally Chapter 15 discusses three promising research areas in project management in detail i Sustainability and Project Management ii Project Management in the Era of Big Data and iii the Fourth Industrial Revolution and the New Age Project Management We elaborate on the importance of sustainability in project management practices discuss how developments in data analytics might impact project life cycle management and speculate how the infinite possibilities of the Fourth Industrial Revolution and the new technologies will transform project management practices

Level Crossing Methods in Stochastic Models Percy H. Brill,2008-12-03 From 1972 to 1974 I was working on a PhD thesis entitled Multiple Server Queues with Service Time Depending on Waiting Time The method of analysis was the embedded Markov chain technique described in the papers 82 and 77 My analysis involved lengthy tedious derivations of systems of integral equations for the probability density function pdf of the waiting time After pondering for many months whether there might be a faster easier way to derive the integral equations I finally discovered the basic theorems for such a method in August 1974 The theorems establish a connection between sample path level crossing rates of the virtual wait process and the pdf of the waiting time This connection was not found anywhere else in the literature at the time I immediately developed a comprehensive new methodology for deriving the integral equations based on these theorems and called it system point theory Subsequently it was called system point method or system point level crossing method SPLC or simply LC I rewrote the entire PhD thesis from November 1974 to March 1975 using LC to reach solutions The new thesis was called System Point Theory in Exponential Queues On June 12 1975 I presented an invited talk on the new methodology at the Fifth Conference on Stochastic Processes and their Applications at the University of Maryland Many queueing theorists were present **Combat Modeling** Alan Washburn,Moshe Kress,2009-08-14 Combat Modeling is a systematic learning resource and reference text for the quantitative analysis of combat After a brief overview authors Washburn and Kress present individual chapters on shooting without feedback shooting with feedback target defense attrition models game
