Feeman,2015 The basic mathematics of computerized tomography the CT scan are aptly presented for an audience of undergraduates in mathematics and engineering Assuming no prior background in advanced mathematical analysis topics such as the Fourier transform sampling and discrete approximation algorithms are introduced from scratch and are developed within the context of medical imaging A chapter on magnetic resonance imaging focuses on manipulation of the Bloch equation the system of differential equations that is the foundation of this important technology Extending the ideas of the acclaimed first edition new material has been added to render an even more accessible textbook for course usage This edition includes new discussions of the Radon transform the Dirac delta function and its role in X ray imaging Kacmarz's method and least squares approximation spectral filtering and more Copious examples and exercises several new computer based exercises and additional graphics

have been added to further delineate concepts. The use of technology has been revamped throughout with the incorporation of the open source programming environment R to illustrate examples and composition of graphics. All R code is available as extra source material on SpringerLink. From the reviews of the first edition, This book is valuable for it addresses with care and rigor the relevance of a variety of mathematical topics to a real world problem. This book is well written. It serves its purpose of focusing a variety of mathematical topics onto a real world application that is in its essence mathematics. The Journal of Nuclear Medicine Vol 51 12 December 2010. This new book by Timothy Feeman truly intended to be a beginner's guide makes the subject accessible to undergraduates with a working knowledge of multivariable calculus and some experience with vectors and matrix methods. The author handles the material with clarity and grace. The Mathematical Association of America February 2010. All theoretical material is illustrated with carefully selected examples which are easy to follow. I highly recommend this interesting, accessible to wide audience and well written book dealing with mathematical techniques that support recent ground breaking discoveries in biomedical technology both to students and to specialists.

Zentralblatt MATH Vol 1191 2010 **Computed Tomography** Lawrence A. Shepp, 1983. In this volume the collection of articles by Shepp, Helgason, Radon and others gives mathematicians unfamiliar with applied mathematics a rather full spectrum of models of computed tomography. Included are nice problems both relevant and of intrinsic interest suggested by each of the papers. **Image Reconstruction from Projections** Gabor T. Herman, 1980. Image reconstruction from projections. Probability and random variables. An overview of the process of CT. Physical problems associated with data collection in CT. Computer simulation of data collection in CT. Data collection and reconstruction of the head phantom under various assumptions. Basic concepts of reconstruction algorithms. Backprojection. Discrete Tomography Gabor T. Herman,Attila Kuba,1999-11 Goals of the Book Overthelast thirty yearsthere has been arevolutionindiagnostic radiology as a result oftheemergenceofcomputerized tomography CT which is the process of obtaining the density distribution within the human body from multiple x ray projections Since an enormous variety of possible density values may occur in the body a large number of projections are necessary to ensure the accurate reconstruction oftheir distribution There are other situations in which we desire to reconstruct an object from its projections but in which we know that the object to be recon stucted has only a small number of possible values For example a large fraction of objects scanned in industrial CT for the purpose of nonde structive testing or reverse engineering are made of a single material and so the ideal reconstruction should contain only two values zero for air and the value associated with the material composing the object Similar as sumptions may even be made for some specific medical applications for example in angiography ofthe heart chambers the value is either zero in dicating the absence of dye or the value associated with the dye in the chamber Another example arises in the electron microscopy of biological macromolecules where we may assume that the object to be reconstructed is composed of ice protein and RNA One can also apply electron mi croscopy to determine the presenceor absence ofatoms in crystallinestruc tures which is again a two valued situation *Computed Tomography* Lawrence A.
