Marco Ceccarelli, 2013-03-09 This book has evolved from a course on Mechanics of Robots that the author has thought for
over a dozen years at the University of Cassino at Cassino Italy It is addressed mainly to graduate students in mechanical
engineering although the course has also attracted students in electrical engineering The purpose of the book consists of
presenting robots and robotized systems in such a way that they can be used and designed for industrial and innovative non
industrial applications with no great efforts The content of the book has been kept at a fairly practical level with the aim to
teach how to model simulate and operate robotic mechanical systems The chapters have been written and organized in a way
that they can be read even separately so that they can be used separately for different courses and readers However many
advanced concepts are briefly explained and their use is emphasized with illustrative examples Therefore the book is directed
not only to students but also to robot users both from practical and theoretical viewpoints In fact topics that are treated in
the book have been selected as of current interest in the field of Robotics Some of the material presented is based upon the
author's own research in the field since the late 1980s **Matrices and Determinoids** Cuthbert Edmund Cullis, 1913
