Grid Computing Fran Berman, Geoffrey Fox, Anthony J. G. Hey, 2003-04-18 Grid computing is applying the resources of many computers in a network to a single problem at the same time. Grid computing appears to be a promising trend for three reasons: 1. Its ability to make more cost effective use of a given amount of computer resources. 2. As a way to solve problems that can't be approached without an enormous amount of computing power. 3. Because it suggests that the resources of many computers can be cooperatively and perhaps synergistically harnessed and managed as a collaboration toward a common objective. A number of corporations, professional groups, university consortiums and other groups have developed or are developing frameworks and software for managing grid computing projects. The European Community EU is sponsoring a project for a grid for high energy physics, earth observation and biology applications. In the United States, the National Technology Grid is prototyping a computational grid for infrastructure and an access grid for people. Sun Microsystems offers Grid Engine software. Described as a distributed resource management tool, Grid Engine allows engineers at companies like Sony and Synopsys to pool the computer cycles on up to 80 workstations at a time. The Grid is a very hot topic, generating broad interest from research and industry, e.g. IBM Platform Avaki, Entropia, Sun, HP. Grid architecture enables very popular e-Science projects like the Genome project, which demand global interaction and networking. In recent surveys, over 50% of Chief Information Officers are expected to use Grid technology this year. Grid Computing Features contributions from the major players in the field. Covers all aspects of grid technology from motivation to applications. Provides an extensive state-of-the-art guide in grid computing. This is essential reading for researchers in Computing and Engineering, physicists, statisticians, engineers and mathematicians, and IT policy makers.

Software Pioneers Manfred Broy, Ernst Denert, 2012-12-06 A lucid statement of the philosophy of modular programming can be found in a 1970 textbook on the design of system programs by Gouthier and Pont 1 1 Cf10 23 which we quote below. A well defined segmentation of the project effort ensures system modularity. Each task forms a separate distinct program module. At implementation time each module and its inputs and outputs are well defined; there is no confusion in the intended interface with other system modules. At checkout time the integrity of the module is tested independently; there are few scheduling problems in synchronizing the completion of several tasks before checkout can begin. Finally the system is maintained in modular fashion; system errors and deficiencies can be traced to specific system modules, thus limiting the scope of detailed error searching. Usually nothing is said about the criteria to be used in dividing the system into modules. This paper will discuss that issue and by means of examples suggest some criteria which can be used in decomposing a system into modules. A Brief Status Report The major advancement in the area of modular programming has been the development of coding techniques and assemblers which 1. allow one module to be written with little knowledge of the code in another module and 2. allow modules to be reassembled and replaced without reassembly of the whole system.

The 6th International Conference on Distributed Computing Systems, Cambridge, Massachusetts, May 19-23, 1986, 1986. **Advances in Grid and Pervasive Computing** Song Wu, Laurence Tianruo Yang, Tony Li Xu, 2008-05-13. Welcome to the proceedings of the 2008 International Conference on Grid and Pervasive Computing (GPC 2008) which was held in Kunming, Yunnan, China, May 25-28, 2008. Gridcomputing presents a new trend in distributed computing for coordinating large-scale heterogeneous resource sharing and problem solving in dynamic, multi-institutional virtual organizations. Grid computing not only can be used for distributed supercomputing, massive data processing, but can also be a common platform and way for utility and service computing. It covers mainframes or supercomputers as well as more powerful personal computers and even small and smart devices ranging from personal digital assistants to unseen chips in our cars, appliances, and telephones. Projecting this trend into the future, we envision an explosion of interconnected high-performance computers and smart devices that can make our research and daily lives easier and more productive. Grid and Pervasive Computing (GPC) is an annual international conference on the emerging areas of merging grid computing and pervasive computing. GPC provides a high-profile leading-edge forum for researchers and
