**Quasicrystals** J.-B. Suck, M. Schreiber, P. Häussler, 2013-04-17 Quasicrystals have been the object of intense research efforts for a good 16 years now. In recent years this area of solid state physics and crystallography has grown into a mature field in its own right. Hence several books on quasicrystals have appeared in the interim see Appendix and chapters on quasicrystals have been introduced into new books on solid state physics and into new editions of existing monographs. However, most of the former have been written for scientists specialised in this field rather than for students and the latter additions are often rather brief. We therefore decided to fill the gap between these two extremes with a book which provides an introduction to the structure and physical properties of quasicrystals and covers in sufficient detail all important fields in quasicrystal research and even applications. The chapters have been written by specialists and each is based on the author's insight into this field. However, much effort has been put into achieving an introductory character and making the text accessible to newcomers to the field.

*Aperiodic '94 - Proceedings Of The International Conference On Aperiodic Crystals* Gervais Chapuis, W. Paciorek, 1995-06-30 The conference promotes the theoretical and methodological development of crystallographic investigations of aperiodic crystals including modulated structures, polytypes, incommensurate misfit or composite crystals and quasi-crystals. It also promotes scientific interchange among groups working in the various fields of aperiodic materials. Special emphasis will be given to multidisciplinary aspects of aperiodicity.

**Symmetry And Structural Properties Of Condensed Matter, Proceedings Of The International School** Tadeusz Lulek, Wojciech Florek, M. Mucha, 1991-02-28 The contents survey the achievements and research problems connected with an adequate description of condensed matter structure, its phases and other properties in terms of appropriate mathematical tools. The focus is on the following topics: Action of groups on sets and broken symmetries, Racah-Wigner approach to vibrations, electronic states, correlations and superconductivity in multicenter systems, crystallography and its extension.
