Models For Discrete Longitudinal Data:

Models for Discrete Longitudinal Data Geert Molenberghs, Geert Verbeke, 2006-08-30 The linear mixed model has become the main parametric tool for the analysis of continuous longitudinal data as the authors discussed in their 2000 book Without putting too much emphasis on software the book shows how the different approaches can be implemented within the SAS software package The authors received the American Statistical Association's Excellence in Continuing Education Award based on short courses on longitudinal and incomplete data at the Joint Statistical Meetings of 2002 and 2004 *Models for Discrete Longitudinal Data* Geert Molenberghs, 2005 **Bayesian Semiparametric Models for Discrete Longitudinal**

Data Sylvie Tchumtchoua, 2010 Latent Variable Models for Discrete Longitudinal Data with Measurement Error Keith Humphreys, 1996 **Bayesian Hierarchical Models** Peter D. Congdon, 2019-09-16 An intermediate level treatment of Bayesian hierarchical models and their applications this book demonstrates the advantages of a Bayesian approach to data sets involving inferences for collections of related units or variables and in methods where parameters can be treated as random collections Through illustrative data analysis and attention to statistical computing this book facilitates practical implementation of Bayesian hierarchical methods The new edition is a revision of the book Applied Bayesian Hierarchical Methods It maintains a focus on applied modelling and data analysis but now using entirely R based Bayesian computing options It has been updated with a new chapter on regression for causal effects and one on computing options and strategies This latter chapter is particularly important due to recent advances in Bayesian computing and estimation including the development of rjags and rstan It also features updates throughout with new examples The examples exploit and illustrate the broader advantages of the R computing environment while allowing readers to explore alternative likelihood assumptions regression structures and assumptions on prior densities Features Provides a comprehensive and accessible overview of applied Bayesian hierarchical modelling Includes many real data examples to illustrate different modelling topics R code based on rjags jagsUI R2OpenBUGS and rstan is integrated into the book emphasizing implementation Software options and coding principles are introduced in new chapter on computing Programs and data sets available on the book's website

Analysis of Longitudinal Data Peter Diggle, 2002-06-20 This important text has been completely revised and expanded to become the most up to date and thorough professional reference text in this fast moving area of biostatistics medical statistics This new edition contains an additional two chapters The first of these discusses fully parametric models for discrete repeated measures data The second explores statistical models for time dependent predictors where there may be feedback between the predictor and response variables Bayesian Semiparametric Models for Discrete Longitudinal Data Sylvie Tchumtchoua, 2010 Discrete longitudinal data are common in various disciplines and are often used to assess the change over time of one or several outcomes and or what covariates might be associated with the outcomes Existing parametric and nonparametric semiparametric models typically attribute the heterogeneity across subjects and or through

time to the effects of included explanatory variables or the effect of omitted variables that do not vary across subjects and over time This dissertation focuses on developing new flexible semiparametric models for discrete longitudinal data using Dirichlet processes It consists of three parts In chapter 2 we propose a semiparametric Bayesian framework for the analysis of associations among multivariate longitudinal categorical variables in high dimensional data settings This type of data is frequent especially in the social and behavioral sciences A semiparametric hierarchical factor analysis model is developed in which the distributions of the factors are modeled nonparametrically through a dynamic Dirichlet process A Markov chain Monte Carlo algorithm is developed for fitting the model and the methodology is applied to study the dynamics of public attitudes toward science and technology in the United States over the period 1992 2001 In chapter 3 we consider the estimation of nonparametric regression for binary longitudinal data Instead of assuming a parametric link function we specify the joint distribution of the covariates and the latent variable underlying the binary outcome as a multivariate normal with subject and time specific mean vector and covariance matrix We then modeled the distribution of these parameters nonparametrically using a dynamic Dirichlet process The resulting binary regression model is a finite mixture of probit regressions and a nonlinear regression The proposed model is more flexible than the existing models in that it models the relationship between the binary response and the covariates nonparametrically while at the same time allowing the shape of the relationship to change over time The methodology is illustrated using simulated data and a real dataset the data on labor force participation of married women in the US over the period 1979 to 1992 Finally chapter 4 proposes two functional generalized linear models where the response variables are discrete functional data and one of the covariates is also functional Functional regression is combined with penalized B splines in a semiparametric Bayesian framework to jointly estimate the response model and the predictor curves clustering curves with similar shapes The methodology is applied to study the price and bids arrivals dynamics in online auctions using data for the palm M515 Personal Digital Assistant PDA units from eBay com

Advances and Challenges in Parametric and Semi-parametric Analysis for Correlated Data

Brajendra C. Sutradhar, 2016-06-15 This proceedings volume contains eight selected papers that were presented in the International Symposium in Statistics ISS 2015 On Advances in Parametric and Semi parametric Analysis of Multivariate Time Series Spatial temporal and Familial longitudinal Data held in St John s Canada from July 6 to 8 2015 The main objective of the ISS 2015 was the discussion on advances and challenges in parametric and semi parametric analysis for correlated data in both continuous and discrete setups Thus as a reflection of the theme of the symposium the eight papers of this proceedings volume are presented in four parts Part I is comprised of papers examining Elliptical t Distribution Theory In Part II the papers cover spatial and temporal data analysis Part III is focused on longitudinal multinomial models in parametric and semi parametric setups Finally Part IV concludes with a paper on the inferences for longitudinal data subject to a challenge of important covariates selection from a set of large number of covariates available for the individuals in the

study **Dynamic Mixed Models for Familial Longitudinal Data** Brajendra C. Sutradhar, 2011-01-27 This book provides a theoretical foundation for the analysis of discrete data such as count and binary data in the longitudinal setup Unlike the existing books this book uses a class of auto correlation structures to model the longitudinal correlations for the repeated discrete data that accommodates all possible Gaussian type auto correlation models as special cases including the equi correlation models This new dynamic modelling approach is utilized to develop theoretically sound inference techniques such as the generalized quasi likelihood GQL technique for consistent and efficient estimation of the underlying regression effects involved in the model whereas the existing working correlations based GEE generalized estimating equations approach has serious theoretical limitations both for consistent and efficient estimation and the existing random effects based correlations approach is not suitable to model the longitudinal correlations The book has exploited the random effects carefully only to model the correlations of the familial data Subsequently this book has modelled the correlations of the longitudinal data collected from the members of a large number of independent families by using the class of auto correlation structures conditional on the random effects The book also provides models and inferences for discrete longitudinal data in the adaptive clinical trial set up The book is mathematically rigorous and provides details for the development of estimation approaches under selected familial and longitudinal models Further while the book provides special cares for mathematics behind the correlation models it also presents the illustrations of the statistical analysis of various real life data This book will be of interest to the researchers including graduate students in biostatistics and econometrics among other applied statistics research areas Brajendra Sutradhar is a University Research Professor at Memorial University in St John s Canada He is an elected member of the International Statistical Institute and a fellow of the American Statistical Association He has published about 110 papers in statistics journals in the area of multivariate analysis time series analysis including forecasting sampling survival analysis for correlated failure times robust inferences in generalized linear mixed models with outliers and generalized linear longitudinal mixed models with bio statistical and econometric applications He has served as an associate editor for six years for Canadian Journal of Statistics and for four years for the Journal of Environmental and Ecological Statistics He has served for 3 years as a member of the advisory committee on statistical methods in Statistics Canada Professor Sutradhar was awarded 2007 distinguished service award of Statistics Society of Canada for his many years of services to the society including his special services for society s annual meetings *Biostatistical Genetics and Genetic Epidemiology* Robert C. Elston, Jane M. Olson, Lyle Palmer, 2002-04-22 Human Genetics concerns the study of genetic forces in man By studying our genetic make up we are able to understand more about our heritage and evolution Some of the original and most significant research in genetics centred around the study of the genetics of complex diseases genetic epidemiology This is the third in a highly successful series of books based on articles from the Encyclopedia of Biostatistics This volume will be a timely and comprehensive reference for a subject that has seen a recent explosion of interest following

the completion of the first draft of the Human Genome Mapping Project The editors have updated the articles from the Human Genetics section of the EoB have adapted other articles to give them a genetic feel and have included a number of newly commissioned articles to ensure the work is comprehensive and provides a self contained reference
