## **Models Of Language Acquisition Inductive And Deductive Approaches:**

**Models of Language Acquisition** Peter Broeder, Jaap Murre, 2000 This book presents recent advances by leading researchers in computational modelling of language acquisition Sophisticated theoretical models can now be tested using simulation techniques and large corpora of linguistic data Renewed interest in learning neural networks and the ability to test new solutions to fundamental problems has fuelled debates in an already very active field The twenty four authors in this collection of new work have been drawn from departments of linguistics cognitive science psychology and computer science The book as a whole shows what light may be thrown on fundamental problems when powerful computational techniques are combined with real data A central question addressed in the book concerns the extent to which linguistic structure is readily available in the environment The authors consider the evidence in relation to word boundaries and phonotactic structure stress patterns text to speech rules and the mapping of lexical semantics one author arguing that a child's own output may serve as a key source of linguistic input Linguistic structure environment relations are central to the debate on the degree to which language learning is inductive or deductive this issue is considered here in studies of the acquisition of pluralization and inflectional morphology The book examines the power and utility of different modeling formalisms for different problems and approaches how far for example can connectionist models be used as models for language acquisition or Simple Recurrent Networks form the basis of a model of language acquisition To what degree can lexical items and categories be used in the construction of neural network models or Markov chains be deployed to investigate the characteristics of a general language learning algorithm Triggering Learning Algorithm This book will appeal to linguists psychologists cognitive scientists working in language acquisition It will also interest those involved in computational modelling in linguistics and behavioural science

**Connectionist Models of Development** Philip T. Quinlan, 2004-03 Connectionist Models of Development is an edited collection of essays on the current work concerning connectionist or neural network models of human development The brain comprises millions of nerve cells that share myriad connections and this book looks at how human development in these systems is typically characterised as adaptive changes to the strengths of these connections The traditional accounts of connectionist learning based on adaptive changes to weighted connections are explored alongside the dynamic accounts in

which networks generate their own structures as learning proceeds Unlike most connectionist accounts of psychological processes which deal with the fully mature system this text brings to the fore a discussion of developmental processes To investigate human cognitive and perceptual development connectionist models of learning and representation are adopted alongside various aspects of language and knowledge acquisition There are sections on artificial intelligence and how computer programs have been designed to mimic the development processes as well as chapters which describe what is currently known about how real brains develop This book is a much needed addition to the existing literature on connectionist development as it includes up to date examples of research on current controversies in the field as well as new features such as genetic connectionism and biological theories of the brain It will be invaluable to academic researchers post graduates and undergraduates in developmental psychology and those researching connectionist neural networks as well as those in related fields such as psycholinguistics
