Haenszel,2012-12-06 The digestive organs are the most frequent site of cancer in the world accounting for approximately 30% of all malignant tumors This prominent position has been present for many decades in spite of marked shifts in the frequency of cancer of specific organs The most remarkable shift has been the decrease in gastric cancer rates occurring concomitantly with an increase in colon cancer rates in most western industrialized societies Important exceptions to this rule as well as other epidemiologic evidence indicate that the opposite trends for gastric and colon cancers are not inevitable consequences of each other Although genetic ally determined precancerous syndromes are well recognized it is generally agreed that environmental factors play an overriding role in digestive cancer causation The most obvious environmental factors seem to be the result of what we eat drink or smoke Although the nutritional component of the diet is of unquestionable importance the nonnutrient elements in our diet have also proven to be influential causative factors Several studies have focused on the microenvironment at the level of the mucosa or the digestive organs as a micro cosmos where forces promoting and inhibiting carcinogenesis are operating for a prolonged period of time Their interaction eventually determines the presence or absence of a malignant tumor Our understanding of such modulating forces hopefully will someday allow us to modify the microenvironment in a favorable way and attain the goal of cancer prevention **Diseases of the digestive organs** Charles Dettie Aaron,1918 *Diseases of the digestive tract and their treatment* Arthur Everett Austin,1916 *Cumulated Index Medicus* ,1974 *Neoplasms of the Gastrointestinal Tract* William C. Inokuchi, 1986-03-31 The problem of digestive tract tumors presents multifaceted aspects which involve epidemiology pathogenesis histopathology surgery and adjuvant multidisciplinary modality Time trends in cancer mortality vary in the individual cancers Mortality from stomach cancer shows a decreasing tendency in most countries although Japan still has the highest incidence in the world Intestinal other than rectum and pancreatic cancers have shown an increase in most countries while mortality due to liver cell and gallbladder cancer vary greatly by locality Since most cancers are considered to be related to environmental and lifestyle exposures such as diet smoking or excessive drinking there is hope that action on these factors may serve to substantially reduce occurrence of the disease Recent progress in early diagnosis has made it feasible to detect small and minute cancers and these have proven possible to cure with relatively favorable results The most important advancement has come from a multidisciplinary approach to cancer treatment utilizing a balanced application of surgery radiation therapy and chemotherapy A considerable increase in the five year survival rate has been realized in stomach cancer While progress is being made in the practical treatment of this disease it remains far better to prevent than to cure For the first time immunization offers a unique opportunity to prevent liver cell cancer **An Epidemiological Study on Cancer of the Digestive Organs and Respiratory System** Johanna Pernu, 1960 **University Homoeopathic Observer** , 1906 Monographic Medicine: The clinical diagnosis of internal diseases; the blood, digestive system and urology, by L.
