Network Distributed Computing Max K. Goff,2004 Covers technologies protocols messaging software integration collaboration security and more *Efficient Management of Large Metadata Catalogs in a Ubiquitous Computing Environment* Daniel Beatty,2019-04-29 Trends in experimental sciences such as astrophysics have led to many critically needed non normalized and massive metadata catalogs that organize collections of recorded photographic and spectrographic observations of similar size Observations of the night sky can best be presented using a data model that conveys the observations analysis objects contained with the observations and results of analysis pertaining to those objects Such a model is proposed and it is referred to as the internet Flexible Image Transport System iFITS In addition a set of mapping functions to transform instances of the Sloan Digital Sky Survey into instances of iFITS a lightweight marshaling method to transfer data to and from server side instances to mobile instances Furthermore this dissertation explores four architectures such as content management software infrastructure platform as a service context rule engine based request response loop factory and representational state transfer REST based query engines to facilitate the mining of the metadata catalogs containing these observations

Aguilera,2012 [Network Topology and Fault-Tolerant Consensus](#) Dimitris Sakavalas,Lewis Tseng,2019-05-13 As the structure of contemporary communication networks grows more complex practical networked distributed systems become prone to component failures Fault tolerant consensus in message passing systems allows participants in the system to agree on a common value despite the malfunction or misbehavior of some components It is a task of fundamental importance for distributed computing due to its numerous applications We summarize studies on the topological conditions that determine the feasibility of consensus mainly focusing on directed networks and the case of restricted topology knowledge at each participant Recently significant efforts have been devoted to fully characterize the underlying communication networks in which variations of fault tolerant consensus can be achieved Although the deduction of analogous topological conditions for undirected networks of known topology had shortly followed the introduction of the problem their extension to the directed network case has been proven a highly non trivial task Moreover global knowledge restrictions inherent in modern large scale networks require more elaborate arguments concerning the locality of distributed computations In this work we present the techniques and ideas used to resolve these issues Recent studies indicate a number of parameters that affect the topological conditions under which consensus can be achieved namely the fault model the degree of system synchrony synchronous vs asynchronous the type of agreement exact vs approximate the level of topology knowledge and the algorithm class used general vs iterative We outline the feasibility and impossibility results for various combinations of the above parameters extensively illustrating the relation between

network topology and consensus **Distributed Computing** David Peleg,2000-01-01 Presents the locality sensitive approach to distributed network algorithms the utilization of locality to simplify control structures and algorithms and reduce their costs The author begins with an introductory exposition of distributed network algorithms focusing on topics that illustrate the role of locality in distributed algorithmic techniques He then introduces locality preserving network representations and describes sequential and distributed techniques for their construction Finally the applicability of the locality sensitive approach is demonstrated through several applications Gives a thorough exposition of network spanners and other locality preserving network representations such as sparse covers and partitions The book is useful for computer scientists interested in distributed computing electrical engineers interested in network architectures and protocols and for discrete mathematicians and graph theorists **Distributed Systems** Sukumar Ghosh,2006-11-22 Most applications in distributed computing center around a set of common subproblems Distributed Systems An Algorithmic Approach presents the algorithmic issues and necessary background theory that are needed to properly understand these challenges Achieving a balance between theory and practice this book bridges the gap between

Networks and Distributed Computation Michel Raynal,1988 Networks and Distributed Computationcovers the recent rapid developments in distributed systems It introduces the basic tools for the design and analysis of systems involving large scale concurrency with examples based on network systems considers problems of network and global state learning discusses protocols allowing synchronization constraints to be distributed and analyzes the fundamental elements of distribution in detail using a large number of algorithms Interprocess communication and synchronization are central issues in the design of distributed systems taking on a different character from their counterparts in centralized systems Raynal addresses these issues in detail and develops a coherent framework for presenting and analyzing a wide variety of algorithms relevant to distributed computation

algorithms for distributed systems so that the reader can get a feel of the nature of this exciting and fascinating field called distributed computing The book will appeal to the educated layperson and requires no computer related background I strongly suspect that also most computer knowledgeable readers will be able to learn something new
