Modelling Future Telecommunications Systems:

Modelling Future Telecommunications Systems P. Cochrane, David J.T. Heatley, 2012-12-06 Telecommunications today is in the midst of far reaching changes due to rapid development of new technologies services and social evolution This is the first book to model the process of change in telecommunications including all of the relevant factors The approach is practical and responsible based on hard facts and tested models It deals with fundamental issues affecting the future development of telecoms and its impact on societies and presents views which some will find radical **IEEE International Conference on Personal Wireless Communications** ,1997 *U.S. Government Research & Development Reports* ,1970 *Railway Signaling and Communications* ,1964 **Discrete-Time Models for Communication Systems Including ATM** Herwig Bruneel, Byung G. Kim, 1992-12-31 Most queueing analyses performed in the literature are based on characterization of queueing phenomena in continuous time items Recently in the telecommunication industries BISDN broadband integrated services digital network has received considerable attention since it can provide a common interface for future communication needs including video data and speech Since information in BISDN is transported by means of discrete units of 53 octet ATM asynchronous transfer mode cells interests in discrete time systems have increased Discrete Time Models for Communication Systems Including ATM provides a general framework for queueing analyses of discrete time systems After a brief look at past studies of discrete time systems a detailed description and analysis are presented for a generic discrete time model with a single server arbitrary service times and independent arrivals The book then follows a less stringent approach and focuses more on the average statistics and on different queueing disciplines Conventional first in out and last in first out disciplines are discussed in terms of the average statistics Systems with multiple classes of messages without class dependent priorities are considered to establish a discrete time conservation law Multiple classes with priorities are also considered to derive performance measures of priority scheduling disciplines Finally a multi queue system with cyclic service is analyzed in the context of round robin service ordering This is followed by analyses of discrete time queueing systems with more complicated input and output processes Specifically single server systems are investigated whereby either the arrivals or the server is subject to random interruptions Results are mainly obtained in terms of generating functions and mean values of the principal performance measures The influence of the nature of the arrival correlation and the server interruptions on the queueing behavior is discussed Finally the book explores queueing models directly associated with ATM switches and multiplexers This book is a valuable reference and may be used as a text for an advanced course on the subject *Proceedings of the Sixth IEEE Computer Society Workshop on Future Trends of Distributed Computing Systems, October 29-31, 1997, Tunis, Tunisia* ,1997 *Proceedings of the Fourth Workshop on Future Trends of Distributed Computing Systems, September 22-24, 1993, Lisbon, Portugal* ,1993 *Proceedings of the 4th Workshop on title held in Lisbon Portugal in September 1993* Sessions are devoted to multimedia experiments system
