Models Of Language:

<u>Usage-based Models of Language</u> Michael Barlow,Suzanne Kemmer,2000-01 How do humans learn how to speak and understand language For years linguists have developed numerous models in attempts to explain humans ability to communicate through language Historically these approaches were rooted and restricted in rule based linguistic representations Only recently has the field of linguistics been willing to forego formal representations and models to accommodate the usage based perspective of studying language Deviating from traditional methods the contributions presented in this volume are among the first works to approach linguistic theory by developing and utilizing usage based models The contributing authors were among the principal leaders in their fields to leave behind rule based linguistic representations in favor of constraint based systems whose structural properties actually emerge from usage The volume begins with an introductory chapter that defines contributors interpretations of usage based models and theories of language The reason for the shift from formal linguistic theories to the gradual acceptance of usage based models is also examined Using methods such as Cognitive Grammar the Lexical Network Model Competition Model Relational Network Theory and Accessibility Theory the selected works demonstrate how usage based models evince far greater cognitive and neurological plausibility than algorithmic generative models **Computational Modeling of Human Language Acquisition** Afra Alishahi,2010-10-10 Human language acquisition has been studied for centuries but using computational modeling for such studies is a relatively recent trend However computational approaches to language learning have become increasingly popular mainly due to advances in developing machine learning techniques and the availability of vast collections of experimental data on child language learning and child adult interaction Many of the existing computational models attempt to study the complex task of learning a language under cognitive plausibility criteria such as memory and processing limitations that humans face and to explain the developmental stages observed in children By simulating the process of child language learning computational models can show us which linguistic representations are learnable from the input that children have access to and which mechanisms yield the same patterns of behaviour that children exhibit during this process In doing so computational modeling provides insight into the plausible mechanisms involved in human language acquisition and inspires the development of better language models and techniques This book provides an overview of the main research questions in the field of human language acquisition It reviews the most commonly used computational frameworks methodologies and resources for modeling child language learning and the evaluation techniques used for assessing these computational models The book is aimed at cognitive scientists who want to become familiar with the available computational methods for investigating problems related to human language acquisition as well as computational linguists who are interested in applying their skills to the study of child language acquisition Different aspects of language learning are discussed in separate chapters including the acquisition of the individual words the general regularities which govern

word and sentence form and the associations between form and meaning For each of these aspects the challenges of the task are discussed and the relevant empirical findings on children are summarized Furthermore the existing computational models that attempt to simulate the task under study are reviewed and a number of case studies are presented Table of Contents Overview Computational Models of Language Learning Learning Words Putting Words Together Form Meaning Associations Final Thoughts   *Models of Language Use and Language Learning in the Theory of Language Didactics* Maria Dakowska,1996   *Neural Models of language Processes* Michael Arbib,2012-12-02 Neural Models of Language Processes offers an interdisciplinary approach to understanding the nature of human language and the means whereby we use it The book is organized into five parts Part I provides an opening framework that addresses three tasks to place neurolinguistics in current perspective to provide two case studies of aphasia and to discuss the rules of the game of the various disciplines that contribute to this volume Part II on artificial intelligence AI and processing models discusses the contribution of AI to neurolinguistics The chapters in this section introduce three AI systems for language perception the HWIM and HEARSAY systems that proceed from an acoustic input to a semantic interpretation of the utterance it represents and Marcus9 system for parsing sentences presented in text Studying these systems demonstrates the virtues of implemented or implementable models Part III on linguistic and psycholinguistic perspectives includes studies such as nonaphasic language behavior and the linguistics and psycholinguistics of sign language Part IV examines neurological perspectives such as the neuropathological basis of Broca s aphasia and the simulation of speech production without a computer Part V on neuroscience and brain theory includes studies such as the histology architectonics and asymmetry of language areas hierarchy and evolution in neurolinguistics and perceptual motor processes and the neural basis of language   **Models of Language Acquisition** Peter Broeder,Jaap Murre,2000 This book presents recent advances by leading researchers in computational modelling of language acquisition The contributors have been drawn from departments of linguistics cognitive science psychology and computer science They show what light can be thrown on fundamental problems whenpowerful computational techniques are combined with real data The book considers the extent to which linguistic structure is readily available in the environment the degree to which language learning is inductive or deductive and the power of different modelling formalisms for different problemsand approaches It will appeal to linguists psychologists cognitive scientists working in language acquisition and to those involved in computational modelling in linguistic and behavioral science   **Mathematical Models of Language** Ferenc Kiefer,1973   Mathematical Models in Linguistics Maurice Gross,1972   **Next Generation AI Language Models in Research** Kashif Naseer Qureshi,Gwanggil Jeon,2024-11-13 In this comprehensive and cutting edge volume Qureshi and Jeon bring together experts from around the world to explore the potential of artificial intelligence models in research and discuss the potential benefits and the concerns and challenges that the rapid development of this field has raised The international chapter contributor group provides a wealth of technical

information on different aspects of AI including key aspects of AI deep learning and machine learning models for AI natural language processing and computer vision reinforcement learning ethics and responsibilities security practical implementation and future directions The contents are balanced in terms of theory methodologies and technical aspects and contributors provide case studies to clearly illustrate the concepts and technical discussions throughout Readers will gain valuable insights into how AI can revolutionize their work in fields including data analytics and pattern identification healthcare research social science research and more and improve their technical skills problem solving abilities and evidence based decision making Additionally they will be cognizant of the limitations and challenges the ethical implications and security concerns related to language models which will enable them to make more informed choices regarding their implementation This book is an invaluable resource for undergraduate and graduate students who want to understand AI models recent trends in the area and technical and ethical aspects of AI Companies involved in AI development or implementing AI in various fields will also benefit from the book s discussions on both the technical and ethical aspects of this rapidly growing field **Models of Language Development** Rosemary J. Bruce Croft,John Lafferty,2013-04-17 A statisticallanguage model or more simply a language model is a prob abilistic mechanism for generating text Such adefinition is general enough to include an endless variety of schemes However a distinction should be made between generative models which can in principle be used to synthesize artificial text and discriminative techniques to classify text into predefined cat egories The first statisticallanguage modeler was Claude Shannon In exploring the application of his newly founded theory of information to human language Shannon considered language as a statistical source and measured how weH simple n gram models predicted or equivalently compressed natural text To do this he estimated the entropy of English through experiments with human subjects and also estimated the cross entropy of the n gram models on natural 1 text The ability of language models to be quantitatively evaluated in tbis way is one of their important virtues Of course estimating the true entropy of language is an elusive goal aiming at many moving targets since

language is so varied and evolves so quickly Yet fifty years after Shannon s study language models remain by all measures far from the Shannon entropy liInit in terms of their predictive power However tbis has not kept them from being useful for a variety of text processing tasks and moreover can be viewed as encouragement that there is still great room for improvement in statisticallanguage modeling
