Models Of Human Memory:

Models of Human Memory Donald A. Norman, 2013-10-22 Models of Human Memory provides an overview of the state of knowledge on human memory models. The book begins with an introductory chapter on the basic stages of the memory system and the historical roots of memory models. The remaining chapters are organized into five parts. Part I on memory systems covers topics such as a system for perception and memory, multi-trace strength theory of memory, and a model for post-perceptual verbal memory that postulates a single memory store with multiple copies called replicas created in memory by rehearsal processes. Part II presents studies on phoneme storage and word recognition. Part III on memory for associations examines the storage-retrieval theory for the memorizing processes and presents a simple model of short-term memory (STM) for paired associates. Part IV on storage and retrieval mechanisms deals with mechanisms of repetition and rehearsal in short-term memory models of recall and recognition and memory search models. Part V presents a theory of human long-term associative memory and examines conceptual and methodological interactions between information processing investigations of cognitive activity and attempts to build models of memory.

Cognitive Models of Memory Martin A. Conway, 1997 The chapters of this volume evaluate models of the short-term retention of knowledge, conceptual knowledge, autobiographical knowledge, transitory mental representations, the neurobiological basis of memory, and age-related changes in human memory.

On Human Memory Chizuko Izawa, 1999-04 This volume honors the Atkinson-Shiffrin model of memory proposed in 1968 with chapters that critique, extend, and build off this influential development in cognitive psychology. For memory researchers, cognitive scientists, and historians of psychology.

Introduction to Human Memory (PLE: Memory) Vernon Gregg, 2014-05-09 Originally published in 1986, this book was written for undergraduates who had completed an introductory course in psychology and aimed to acquaint the student with the core of recent experimental findings and theoretical ideas concerning human memory. Each chapter deals with a specific area of memory research, but care is taken to build on what has been covered in preceding chapters, so providing an integrated treatment of the subject. Thus, the book can comfortably be read from cover to cover, or selected issues can be referred to in isolation. Important features of the book include discussion of fundamental issues about the nature of the scientific process, the role of models and theories in it, and the historical development of models of human memory. Also, the treatment of forgetting includes chapters on motivational aspects, psychopathological forgetting, post-hypnotic amnesia, and directed forgetting and organic amnesia.

Cognitive Modeling of Human Memory and Learning Lidia Ghosh, Amit Konar, Pratyusha Rakshit, 2020-10-06 Proposes computational models of human memory and learning using a brain-computer interfacing (BCI) approach. Human memory modeling is important from two perspectives. First, the precise fitting of the model to an individual's short-term or working memory may help in predicting memory performance of the subject in the future. Second, memory models provide a biological insight to the encoding and recall mechanisms undertaken by the neurons present in active brain lobes participating in the

Human Memory: Models of memory and memory systems Chris J. A. Moulin, 2011 *Relating Theory and Data* William E. Hockley, Stephan Lewandowsky, 2014-01-02 This festschrift represents the proceedings of a conference held in honor of Bennet B Murdock one of the foremost researchers and theoreticians on human memory and cognition A highly renowned investigator respected for both his empirical and theoretical contributions to the field Murdock summarized and focused a large amount of research activity with his 1974 book Human Memory Theory and Data This unique collection of articles addresses many of the issues discussed in his classic text Divided into five principal sections its coverage includes theoretical perspectives on human memory ranging from a biological view to an exposition of the value of formal models recent progress in the study of processes in immediate memory and recognition memory and new developments in componential and distributed approaches to the modeling of human memory Each section concludes with an integrative commentary provided by some of Murdock's eminent colleagues from the University of Toronto Thus this book offers a diversity of perspectives on contemporary topics in the discipline and will be of interest to students and scholars in all branches of cognitive science

Zimmer,1994 Our memory of simple action phrases such as comb your hair improves by about 50% when we actually act out the phrase Extensive studies on this self performance effect which is not explained by any of the current theories of episodic memory led the authors of this book to develop a fascinating multi modal model of memory The central idea of this model is that human information processing is to a certain extent decentralized and that episodic memory performance depends not only on central information processing but also on which systems are actually involved in the encoding and retrieval of the material itself This book describes the practical evidence and theoretical background for this model which not only challenges current concepts in the psychology of memory but also has potentially very important implications about how people might best learn to remember information in our increasingly multi modal information age **Human Memory**

Computational Model of Human Memory Susan Hempinstall, 2016

Theories of Extended Mind have evolved in waves to reach the present state of disagreement with regard to whether or not external artefacts become part of the mind when used for memory purposes A four step approach has been used to address and resolve this disagreement First a new component for models of mind which provides a saliency function is provided This saliency function corresponds to computational elements found necessary in large mainframe computer systems for handling rich data environments Second there is introduced a Computational Model of Memory containing the new component which models the operation of human memory The Computational Model of Memory contains four interoperative elements including the new component short term memory long term memory and a cross reference associator Third the work of Marcin Milkowski is drawn upon to obtain a general method of assessing a computational model's well formedness and the method is applied to prove the adequacy of the Computational Model of Memory According to Milkowski's schema the model satisfies most criteria for a well formed computational model including in particular a separation between conceptual elements of the model and constitutive elements of the model which while explicitly related are required to subsist at separate logical conceptual levels Fourth the Computational Model of Memory is applied to outstanding arguments in Extended Mind to clarify and resolve several of these arguments The model serves to highlight where the nature of the disagreement depends upon a category error of reference and further resolves a key disagreement by demonstrating that the mind may treat external artefacts as an alternative realizable constitutive element of short term and long term memory
