Nerve, Brain and Memory Models, 1963-01-01 Nerve Brain and Memory Models      **Nerve, Brain and Memory Models** Symposium On Cybernetics Of The Nervous System Amsterdam (Amsterdam 1962), 1963      Nerve, Brain and Memory Models Norbert Wiener, J. P. Schadé, 1963      **Nerve, Brain and Memory Models** Norbert Wiener, J. P. Schadé, Koninklijke Nederlandse Akademie van Wetenschappen, 1963      *Decoding EEG Brain Signals using Recurrent Neural Networks* Juri Fedjaev, 2019-01-14 Master's Thesis from the year 2017 in the subject Electrotechnology grade 1.0 Technical University of Munich Neurowissenschaftliche Systemtheorie language English abstract Brain computer interfaces BCIs based on electroencephalography EEG enable direct communication between humans and computers by analyzing brain activity. Specifically, modern BCIs are capable of translating imagined movements into real-life control signals, e.g., to actuate a robotic arm or prosthesis. This type of BCI is already used in rehabilitation robotics and provides an alternative communication channel for patients suffering from amyotrophic lateral sclerosis or severe spinal cord injury. Current state-of-the-art methods are based on traditional machine learning, which involves the identification of discriminative features. This is a challenging task due to the non-linear, non-stationary, and time-varying characteristics of EEG signals, which led to stagnating progress in classification performance. Deep learning alleviates the efforts for manual feature engineering through end-to-end decoding, which potentially presents a promising solution for EEG signal classification. This thesis investigates how deep learning models, such as long short-term memory (LSTM) and convolutional neural networks (CNN), perform on the task of decoding motor imagery movements from EEG signals. For this task, both an LSTM and a CNN model are developed using the latest advances in deep learning, such as batch normalization, dropout, and cropped training strategies for data augmentation. Evaluation is performed on a novel EEG dataset consisting of 20 healthy subjects. The LSTM model reaches the state-of-the-art performance of support vector machines with a cross-validated accuracy of 66.20%. The CNN model, which employs a time-frequency transformation in its first layer, outperforms the LSTM model and reaches a mean accuracy of 84.23%. This shows that deep learning approaches deliver competitive performance without the need for hand-crafted features enabling end-to-end classification.
