Muller, 2000 ABCs of z/OS System Programming Volume 13 Paul Rogers, Juha Vainikainen, IBM Redbooks, 2012-02-07 A major goal of operating systems is to process jobs while making the best use of system resources Thus one way of viewing operating systems is as resource managers Before job processing operating systems reserve input and output resources for jobs During job processing operating systems manage resources such as processors and storage After job processing operating systems free all resources used by the completed jobs making the resources available to other jobs This process is called resource management There is more to the processing of jobs than the managing of resources needed by the jobs At any instant a number of jobs can be in various stages of preparation processing and post processing activity To use resources efficiently operating systems divide jobs into parts They distribute the parts of jobs to queues to wait for needed resources Keeping track of where things are and routing work from queue to queue is called workflow management and is a major function of any operating system JES3 considers job priorities device and processor alternatives and installation specified preferences in preparing jobs for processing job output This IBM Redbooks publication describes a JES3 environment that includes the following Single system image Workload balancing Availability Control flexibility Physical planning flexibility
