Rosengren,Carl N. Johnson,Paul L. Harris,2000-05-29 This volume first published in 2000 is about the development of human thinking that stretches beyond the ordinary boundaries of reality Various research initiatives emerged in the decade prior to publication exploring such matters as children s thinking about imaginary beings magic and the supernatural The purpose of this book is to capture something of the larger spirit of these efforts In many ways this new work offers a counterpoint to research on the development of children s domain specific knowledge about the ordinary nature of things that has suggested that children become increasingly scientific and rational over the course of development In acquiring an intuitive understanding of the physical biological or psychological domains even young children recognize that there are constraints on what can happen However once such constraints are acknowledged children are in a position to think about the violation of those very same constraints to contemplate the impossible **Science Magic Tricks for Kids** Kathy Gendreau,2023-10-17 Is it magic Or is it science Amaze family and friends with these 50 science experiments designed to work as magic tricks Make a flame jump from candle to candle create a cloud in a bottle and keep water from pouring out of an upside down container in this exciting science book for kids Young magicians will thrill to these age appropriate tricks and gain confidence in their scientific knowledge and abilities at the same time Science Magic Tricks for Kids features 50 magic tricks based on science for kids ages 8 12 using common household materials A new way of learning science with clear explanations of the scientific principles behind the magic Easy to follow step by step instructions and a helpful photo for every trick Detailed directions for putting on a spectacular magic show Ask the Audience questions that help kids involve their audience and learn the science before the performance Run with It sections that suggest ways to try each trick with different materials and instructions How will the results of the trick change Written by the owner and founder of STEAMboat Studio a children s education center dedicated to bringing fun hands on STEAM focused learning experiences to students of all ages Science Magic Tricks for Kids is the perfect science book for budding scientists and magicians **Subject Guide to Children's Books In Print, 1996** R R Bowker Publishing,1996 **Forthcoming Books** Rose Arny,1998-06 **The Psychology of Magic and the Magic of Psychology** Amir Raz,Jay A. Olson,Gustav Kuhn,2016-11-18 Magicians have dazzled audiences for many centuries however few researchers have studied how let alone why most tricks work The psychology of magic is a nascent field of research that examines the underlying mechanisms that conjurers use to achieve enchanting phenomena including sensory illusions misdirection of attention and the appearance of mind control and nuanced

persuasion Most studies to date have focused on either the psychological principles involved in watching and performing magic or neuromagic the neural correlates of such phenomena Whereas performers sometimes question the contributions that modern science may offer to the advancement of the magical arts the history of magic reveals that scientific discovery often charts new territories for magicians In this research topic we sketch out the symbiotic relationship between psychological science and the art of magic On the one hand magic can inform psychology with particular benefits for the cognitive social developmental and transcultural components of behavioural science Magicians have a large and robust set of effects that most researchers rarely exploit Incorporating these effects into existing experimental even clinical paradigms paves the road to innovative trajectories in the study of human behaviour For example magic provides an elegant way to study the behaviour of participants who may believe they had made choices that they actually did not make Moreover magic fosters a more ecological approach to experimentation whereby scientists can probe participants in more natural environments compared to the traditional lab based settings Examining how magicians consistently influence spectators for example can elucidate important aspects in the study of persuasion trust decision making and even processes spanning authorship and agency Magic thus offers a largely underused armamentarium for the behavioural scientist and clinician On the other hand psychological science can advance the art of magic The psychology of deception a relatively understudied field explores the intentional creation of false beliefs and how people often go wrong Understanding how to methodically exploit the tenuous twilight zone of human vulnerabilities perceptual logical emotional and temporal becomes all the more revealing when top down influences including expectation symbolic thinking and framing join the fray Over the years science has permitted magicians to concoct increasingly effective routines and to elicit heightened feelings of wonder from audiences Furthermore on occasion science leads to the creation of novel effects or the refinement of existing ones based on systematic methods For example by simulating a specific card routine using a series of computer stimuli researchers have decomposed the effect and reconstructed it into a more effective routine Other magic effects depend on meaningful psychological knowledge such as which type of information is difficult to retain or what changes capture attention Behavioural scientists measure and study these factors By combining analytical findings with performer intuitions psychological science begets effective magic Whereas science strives on parsimony and independent replication of results magic thrives on reproducing the same effect with multiple methods to obscure parsimony and minimise detection This Research Topic explores the seemingly orthogonal approaches of scientists and magicians by highlighting the crosstalk as well as rapprochement between psychological science and the art of deception

Keil,2022-03-01 How we can all be lifelong wonderers restoring the sense of joy in discovery we felt as children From an early age children pepper adults with questions that ask why and how Why do balloons float How do plants grow from seeds Why do birds have feathers Young children have a powerful drive to learn about their world wanting to know not just what something is but also how it got to be that way and how it works Most adults on the other hand have little curiosity about whys and hows we might unlock a door for example or boil an egg with no idea of what happens to make such a thing possible How can grown ups recapture a child's sense of wonder at the world In this book Frank Keil describes the cognitive dispositions that set children on their paths of discovery and explains how we can all become lifelong wonderers Keil describes recent research on children's minds that reveals an extraordinary set of emerging abilities that underpin their joy of discovery their need to learn not just the facts but the underlying causal patterns at the very heart of science This glorious sense of wonder however is stifled beginning in elementary school Later with little interest in causal mechanisms and motivated by intellectual blind spots as adults we become vulnerable to misinformation and manipulation ready to believe things that aren't true Of course the polymaths among us have retained their sense of wonder and Keil explains the habits of mind and ways of wondering that allow them and can enable us to experience the joy of asking why and how **Junior High School Library Catalog** ,1990 The Cumulative Book Index ,1996 A world list of books in the English language
