Samuel, 2019 One of the most important and useful tools used in the study of partial differential equations is the maximum principle. This principle is a natural extension to higher dimensions of an elementary fact of calculus: any function which satisfies the inequality $f \leq 0$ on an interval $a \leq b$ achieves its maximum at one of the endpoints of the interval. In this context we say that the solution to the differential inequality $f \leq 0$ satisfies a maximum principle. In this thesis we will discuss the maximum principles for partial differential equations and their applications. More precisely we will show how one may employ the maximum principles to obtain information about uniqueness, approximation, boundedness, convexity, symmetry, or asymptotic behavior of solutions without any explicit knowledge of the solutions themselves. The thesis will be organized in two main parts. The purpose of the first part is to briefly introduce in Chapter 1 the terminology and the main tools to be used throughout this thesis. We will start by introducing the second order linear differential operators of elliptic and parabolic type. Then we will develop the first and second maximum principles of E. Hopf for elliptic equations respectively the maximum principles of L. Nirenberg and A. Friedman for parabolic equations. Next in the second part, namely in Chapter 2 and 3 we will introduce various P functions which are nothing else than appropriate functional combinations of the solutions and their derivatives and derive new maximum principles for such functionals. Moreover we will show how to employ these new maximum principles to get isoperimetric inequalities, symmetry results and convexity results in the elliptic case Chapter 2 respectively spatial and temporal asymptotic behavior of solutions in the parabolic case Chapter 3. Abstract Order Structure And Topological Methods In Nonlinear Partial Differential Equations: Vol. 1: Maximum Principles And Applications Yihong Du, 2006-01-12 The maximum principle induces an order structure for partial differential equations and has become an important tool in nonlinear analysis. This book is the first of two volumes to systematically introduce the applications of order structure in certain nonlinear partial differential equation problems. The maximum principle is revisited through the use of the Krein-Rutman theorem and the principal eigenvalues. Its various versions such as the moving plane and sliding plane methods are applied to a variety of important problems of current interest. The upper and lower solution method, especially its weak version, is presented in its most up to date form with enough generality to cater for wide applications. Recent progress on the boundary blow up problems and their applications are discussed as well as some new symmetry and Liouville type results.

G. Maz_i_a_,2012-08-15 The main goal of this book is to present results pertaining to various versions of the maximum principle for elliptic and parabolic systems of arbitrary order In particular the authors present necessary and sufficient conditions for validity of the classical maximum modulus principles for systems of second order and obtain sharp constants in inequalities of Miranda Agmon type and in many other inequalities of a similar nature Somewhat related to this topic are explicit formulas for the norms and the essential norms of boundary integral operators The proofs are based on a unified approach using on one hand representations of the norms of matrix valued integral operators whose target spaces are linear and finite dimensional and on the other hand on solving certain finite dimensional optimization problems This book reflects results obtained by the authors and can be useful to research mathematicians and graduate students interested in partial differential equations
