## **Measurement In Social Science:**

*Conceptualization and Measurement in the Social Sciences* Hubert M. Blalock, 1982 This is the paperback edition of the classic *Conceptualization and Measurement in the Social Sciences* first published in hardback in 1982 Blalock challenges social scientists to move beyond simple manipulation of numbers for he believes that significant advances in methods are impossible without conceptual developments to give them meaning He carefully describes the relationship between theory and method examining central issues such as the generalizability and comparability of measurements and the omission of important variables when analyzing data

*Measurement in the Social Sciences* Richard A. Zeller, Edward G. Carmines, 1980-04-30 This textbook is designed to bridge the gap between the theorist and the methodologist by presenting an integrated approach to measurement By differentiating between random and systematic error it conveys both statistical techniques and their theoretical underpinnings essential to students of sociology and political science Rather than developing new technical methods of new theoretical structures Professors Zeller and Carmines provide thorough explanations of the assumptions limitations and interpretations of previously established techniques and theories Written at a level accessible to students of social science with some statistical training the book does not presume a sophisticated mathematical background By concentrating on synthesizing the methodological and theoretical realms Zeller and Carmines demonstrate why measurement considerations are important to research and how measurement principles can be most effectively applied

*Measurements in the Social Sciences* Hubert M. Blalock, 1974 Among the frustrations constantly confronting the social scientist are those associated with the general process of measurement The importance of good measurement has long been recognized in principle but it has often been neglected in practice in many of the social sciences Now that the methodological tools of multivariate analysis simultaneous equation estimation and causal modeling are diffused more widely into the social sciences and now that the very serious implications of random and non random measurement errors are being systematically investigated it is all the more important that social scientists give top priority to the quality of their data and the clarity of their theoretical conceptualizations as well as to methods for analyzing fallible data This book deals with selected problems of measurement and is written for graduate students and professional social scientists particularly in the technically less developed fields of sociology political science and anthropology The book is organized so that in general one proceeds from problems of data collection to those of data analysis It is not intended to be a complete work covering all types of measurement problems that have arisen in the social sciences Instead it represents a series of studies of topics that are deemed to be crucial for the advancement of social science research but which have not received sufficient attention in most of the social sciences The basic purpose is to stimulate further methodological research on measurement and to study the ways in which knowledge that has been accumulated in some fields may be generalized so that it may be applied to others The book is divided into three major parts Part I is concerned with applying scaling approaches developed in psychometrics

to problems that arise in other social sciences The focus is on finding better ways to ask questions of respondents so as to raise the level of measurement above that of simple ordinal scales Part II focuses on multiple indicator theory and strategies as applied to relatively complex models and to change data In this section the emphasis shifts to how one analyzes fallible data through the construction of explicit measurement error models Part III deals with the statistical analysis of ordinal data including the interpretation and empirical behaviors of various ordinal measures of association The final chapter written by the editor discusses how ordered metric assumptions may be used to make more powerful predictions than those characterizing much of contemporary social science

H M Blalock Jr 1926 1991 was Professor Department of Sociology the University of Washington Seattle He was recipient of the 1973 ASA Samuel Stouffer Prize and was a Fellow of the American Statistical Association and the American Academy of Arts and Sciences and is a member of the National Academy of Sciences He was the 70th president of the American Sociological Association *Handbook of Research Design and Social Measurement* Delbert Charles Miller, 1983

Black, 1999-03-30 This original textbook provides a comprehensive and integrated approach to using quantitative methods in the social sciences Thomas R Black guides the student and researcher through the minefield of potential problems that may be confronted and it is this emphasis on the practical that distinguishes his book from others which focus exclusively on either research design and measurement or statistical methods Focusing on the design and execution of research key topics such as planning sampling the design of measuring instruments choice of statistical text and interpretation of results are examined within the context of the research process In a lively and accessible style the student is introduced to research design issues alongside statistical procedures and encouraged to develop analytical and decision making skills

necessity by many social science researchers and their students has been revised and updated while retaining the features that made it so useful. The emphasis in this new edition is on the tools with which graduate students and more advanced researchers need to become familiar as well as be able to use in order to conduct high quality research. *Measurement for the Social Sciences* John R. Rossiter, 2014-10-10. This book proposes a revolutionary new theory of construct measurement called C OAR SE for the social sciences. The acronym is derived from the following key elements: construct definition, object representation, attribute classification, rater entity identification, selection of item type, enumeration and scoring. The new theory is applicable to the design of measures of constructs in Management, Marketing, Information Systems, Organizational Behavior, Psychology, Sociology. C OAR SE is a rationally rather than empirically based theory and procedure. It can be used for designing measures of the most complex and also the most basic constructs that we use in social science research. C OAR SE is a radical alternative to the traditional empirically based psychometric approach, and a considerable amount of the book's content is devoted to demonstrating why the psychometric approach does not produce valid measures. The book argues that the psychometric approach has resulted in many misleading findings in the social sciences and has led to erroneous acceptance or rejection of many of our main theories and hypotheses, and that the C OAR SE approach to measurement would correct this massive problem. The main purpose of this book is to introduce and explain C OAR SE construct measurement theory in a way that will be understood by all social science researchers and that can be applied to designing new, more valid measures. Featuring numerous examples, practical applications, end of chapter questions, and appendices, the book will serve as an essential resource for students and professional researchers alike.
