Modeling And Computational Methods For Kinetic Equations:

Modeling and Computational Methods for Kinetic Equations Pierre Degond, Lorenzo Pareschi, Giovanni Russo, 2004-04-07 In recent years kinetic theory has developed in many areas of the physical sciences and engineering and has extended the borders of its traditional fields of application. New applications in traffic flow engineering, granular media modeling and polymer and phase transition physics have resulted in new numerical algorithms which depart from traditional stochastic Monte Carlo methods. This monograph is a self-contained presentation of such recently developed aspects of kinetic theory as well as a comprehensive account of the fundamentals of the theory. Emphasizing modeling techniques and numerical methods, the book provides a unified treatment of kinetic equations not found in more focused theoretical or applied works. The book is divided into two parts. Part I is devoted to the most fundamental kinetic model, the Boltzmann equation of rarefied gas dynamics. Additionally, widely used numerical methods for the discretization of the Boltzmann equation are reviewed: the Monte Carlo method, spectral methods and finite difference methods. Part II considers specific applications: plasma kinetic modeling using the Landau-Fokker-Planck equations, traffic flow modeling, granular media modeling, quantum kinetic modeling and coagulation-fragmentation problems. Modeling and Computational Methods of Kinetic Equations will be accessible to readers working in different communities where kinetic theory is important: graduate students, researchers and practitioners in mathematical physics, applied mathematics and various branches of engineering. The work may be used for self-study as a reference text or in graduate level courses in kinetic theory and its applications.

Modeling and Computational Methods for Multi-scale Quantum Dynamics and Kinetic Equations, 2013 This dissertation consists of two parts: quantum transitions (Part 1) and hydrodynamic limits of kinetic equations (Part 2). In both parts we investigate the inner mathematical connections between equations for different physics at different scales and use these connections to design efficient computational methods for multi-scale problems. Despite its numerous applications in chemistry and physics, the mathematics of quantum transition is not well understood. Using the Wigner transformation we derive semi-classical models in phase space for two problems: the dynamics of electrons in crystals near band crossing points and surface hopping of quantum molecules when the Born-Oppenheimer approximation breaks down. In both cases particles may jump between states with comparable energies. Our models can capture the transition rates for such processes. We provide analytic analysis of and numerical methods for our models, demonstrated by explicit examples. The second part is to construct numerical methods for kinetic equations that are efficient in the hydrodynamic regime. Asymptotically, the kinetic equations reduce to fluid dynamics described by the Euler or Navier-Stokes equations in the fluid regime. Numerically, the Boltzmann equation is still hard to handle in the hydrodynamic regime due to the stiff collision term. We review the theoretical work that links the two sets of equations and present our asymptotic preserving numerical solvers for the Boltzmann equation that naturally capture the asymptotic limits in the hydrodynamic regime. We also extend our methods to the case of multi-species.

This book presents the proceedings of the international conference Particle Systems and Partial Differential Equations V which was held at the University of Minho Braga Portugal from the 28th to 30th November 2016 It includes papers on mathematical problems motivated by various applications in physics engineering economics chemistry and biology The purpose of the conference was to bring together prominent researchers working in the fields of particle systems and partial

differential equations providing a venue for them to present their latest findings and discuss their areas of expertise. Further it was intended to introduce a vast and varied public including young researchers to the subject of interacting particle systems its underlying motivation and its relation to partial differential equations. The book appeals to probabilists, analysts and also to mathematicians in general whose work focuses on topics in mathematical physics, stochastic processes and differential equations as well as to physicists working in the area of statistical mechanics and kinetic theory.

Munz, 2003-05-19 The papers in these proceedings were peer reviewed. The RGD Symposia are highly interdisciplinary and encompass all aspects of rarefaction and non equilibrium phenomena in gases. Rarefied flow phenomena include the mechanics and physics of low density gases and the analysis of flows which take place on a spatial scale comparable to the mean free path of a gas. Topics covered include Kinetic theory and transport theory, numerical methods including direct simulation Monte Carlo and molecular dynamics, gas surface phenomena, nano and microscale flows, molecular beams, atom and molecular optics, clusters and aerosols, external flows including space and vacuum technologies, plume flows, hypersonic flows, molecular collision dynamics, relaxation processes, ionized gas flows, physics of the space environment, plasma processing, experimental techniques, diagnostics including laser induced fluorescence and electron beams applications. With the increase in space activities and microfabrication capabilities new themes have emerged including rarefied hypersonic flows, non equilibrium gases, plasma processing, nano and micro scale flows at relatively high pressures along with parallel and hybrid computational developments. Because the RGD Symposia are recognized as the principle forum for the presentation of recent advances in this field it is a must for engineers and scientists in a variety of specialties **Remeshed Smoothed Particle Hydrodynamics for the Simulation of Compressible, Viscous, Heat Conducting, Reacting & Interfacial Flows** Andreas Chaniotis, 2003 *Indian Journal of Engineering and*
