Modern Gaas Processing Methods:

Modern GaAs Processing Methods Ralph Williams, 1990 Containing updated material from the first edition this book adds several chapters covering RF testing techniques reliability process and manufacturing disciplines and process development experiment by design *Nonclassical Light from Semiconductor Lasers and LEDs* Jungsang Kim, Seema Somani, Yoshihisa Yamamoto, 2012-12-06 The quantum statistical properties of light generated in a semiconductor laser and a light emitting diode LED have been a eld of intense research for more than a decade This research monograph discusses recent research activities in nonclassical light generation based on semiconductor devices performed mostly at Stanford University When a semiconductor material is used as the active medium to generate photons as in semiconductor lasers and LEDs the ow of carriers electrons andholes isconvertedintoa owofphotons Providedthattheconversionis fast and e cient the statistical properties of the carriers pump noise can be transferred to the photons if pump noise can be suppressed to below the shot noise value the noise in the photon output can also be suppressed below thePoissonlimit Sinceelectronsandholesarefermionsandhavecharges the statisticalpropertiesoftheseparticlescanbesigni cantlydi erentfromthose of photons if the structure of the light emitting device is properly designed to provide interaction between these particles There has been a discrepancy between the theoretical understanding and experimental observation of noise in a macroscopic resistor until very cently The dissipation that electrons experience in a resistor is expected to accompany the uctuation due to partition noise leading to shot noise in the large dissipation limit as is the case with photons Experimental observation shows that thermal noise expected only in a thermal equilibrium situation zero bias condition is the only source of noise featured by a resistor dependent of the current **Handbook of RF and Microwave Power Amplifiers** John L. III-Nitride, SiC, and Diamond Materials for Electronic Devices: Volume 423 D. Kurt Gaskill, Charles D. Brandt, Robert J. Nemanich, 1996-11-15 This book differs from previous volumes on wide bandgap semiconductors in that the emphasis is specifically on materials aspects related to electronic properties and devices. Solid advances are reported in the growth techniques of all three materials groups. In particular, the critical importance of surfaces, interfaces, doping, defects and impurities is demonstrated. Potential device applications ranging from new high frequency high power all solid state devices to unique cold cathode electronic devices are presented. Whilst the results demonstrate real promise for a wide range of new solid state devices that are not feasible with current production materials, it is also evident that substantial progress in materials research is needed to fulfill the real potential of these applications. Critical issues related to the electronic potential of all three materials are addressed. Topics include device technologies, devices, metallizations, etching and implantation, bulk and bulk-like crystal growth, film growth, defects and structural properties, doping and electrical properties and optical and field emission properties.
