Programming in Networks and Graphs Ulrich Derigs, 2013-11-11 Network flow and matching are often treated separately in the literature and for each class a variety of different algorithms has been developed These algorithms are usually classified as primal dual primal dual etc The question the author addresses in this work is that of the existence of a common combinatorial principle which might be inherent in all those apparently different approaches It is shown that all common network flow and matching algorithms implicitly follow the so called shortest augmenting path This can be interpreted as a greedy like decision rule where the optimal solution is built up through a sequence of local optimal solutions The efficiency of this approach is realized by combining this myopic decision rule with an anticipant organization The approach of this work is organized as follows For several standard flow and matching problems the common solution procedures are first reviewed It is then shown that they all reduce to a common basic principle that is they all perform the same computational steps if certain conditions are set properly and ties are broken according to a common rule Recognizing this near equivalence of all commonly used algorithms the question of the best method has to be modified all methods are only different implementations of the same algorithm obtained by different views of the problem

Graphs, Networks and Algorithms Dieter Jungnickel, 2012-11-08 From the reviews of the previous editions The book is a first class textbook and seems to be indispensable for everybody who has to teach combinatorial optimization It is very helpful for students teachers and researchers in this area The author finds a striking synthesis of nice and interesting mathematical results and practical applications the author pays much attention to the inclusion of well chosen exercises The reader does not remain helpless solutions or at least hints are given in the appendix Except for some small basic mathematical and algorithmic knowledge the book is self contained

K Engel

Mathematical Reviews 2002 The substantial development effort of this text involving multiple editions and trailing in the context of various workshops university courses and seminar series clearly shows through in this new edition with its clear

writing good organisation comprehensive coverage of essential theory and well chosen applications The proofs of important results and the representation of key algorithms in a Pascal like notation allow this book to be used in a high level undergraduate or low level graduate course on graph theory combinatorial optimization or computer science algorithms The well worked solutions to exercises are a real bonus for self study by students The book is highly recommended P B Gibbons Zentralblatt f r Mathematik 2005 Once again the new edition has been thoroughly revised In particular some further material has been added more on NP completeness especially on dominating sets a section on the Gallai Edmonds structure theory for matchings and about a dozen additional exercises as always with solutions Moreover the section on the 1 factor theorem has been completely rewritten it now presents a short direct proof for the more general Berge Tutte formula Several recent research developments are discussed and quite a few references have been added
