

■ INTRODUCTION

The future laparoscopic technology includes three-dimensional virtual reality and expands the scanning rate from 525 lines of resolution to 1,000 or 1,200 lines per frame and the quality of picture would be twice better than existing system.

With virtual reality, a three-dimensional computer image is presented through liquid crystal glasses.

The future of three-dimensional images is not far away and many instrument companies have prototype in the field (Fig. 1).

Laparoscopic surgery is growing in such a speed that three-dimensional image projection system is going to replace the conventional monitor in near future and surgeon will get a virtual image in air just above the body cavity. This new projection system will abolish all the limitations of current two-dimensional images without degrading the image.

■ NATURAL ORIFICE TRANSLUMINAL ENDOSCOPIC SURGERY

Over the past 10 years, the major drive in surgery has been the development and application of minimal access approaches to traditional operations. This philosophy has crossed all surgical specialties and has had a major impact on training, technological development, and patient care.

In 2000, the emphasis has been on laparoscopic techniques, which can now be applied to the majority of intra-abdominal procedures. Evidence suggests that the fistula in trauma to the abdominal wall and the fistula in the pancreoperitoneum have a positive impact on patients undergoing abdominal operations.

Though still not widely applied, these techniques have surgeons on notice that flexible endoscopy may become an important component of their practice.

Surgeons have gone beyond the luminal confines of the gastrointestinal tract to perform intra-abdominal procedures. With existing flexible endoscopic instrumentation, the wall of the stomach is punctured and an endoscope is advanced into the peritoneal cavity to perform various procedures; thus far, the use of this technique for diagnostic exploration, liver biopsy, cholecystectomy, splenectomy, and tubal ligation has been reported in animal models. Recently, transvaginal endoscopic cholecystectomy is performed in France (Figs. 2A to F).

After the intervention is finished, the scope is pulled back into the stomach and the puncture is closed. Several videos have been shown at scientific meetings that suggest that at least transgastric appendectomy has been performed in humans. Other natural orifices, such as the anus or vagina, also allow access to the peritoneal cavity (Figs. 3A to C). Although in its infancy, the performance of natural orifice transluminal endoscopic surgery (NOTES) may, thus, further revolutionize the field of abdominal surgery.

Obviously questions are raised by the possibilities of NOTES:

- Is there any clinical advantage to avoiding incisions in the abdominal wall? Can the visceral wall be closed safely and reliably?

Encyclopedia Of Medical Robotics, The (In 4 Volumes)

,2018-08-28 The Encyclopedia of Medical Robotics combines contributions in four distinct areas of Medical robotics namely Minimally Invasive Surgical Robotics Micro and Nano Robotics in Medicine Image guided Surgical Procedures and Interventions and Rehabilitation Robotics The volume on Minimally Invasive Surgical Robotics focuses on robotic technologies geared towards challenges and opportunities in minimally invasive surgery and the research design implementation and clinical use of minimally invasive robotic systems The volume on Micro and Nano robotics in Medicine is dedicated to research activities in an area of emerging interdisciplinary technology that is raising new scientific challenges and promising revolutionary advancement in applications such as medicine and biology The size and range of these systems are at or below the micrometer scale and comprise assemblies of micro and nanoscale components The volume on Image

guided Surgical Procedures and Interventions focuses primarily on the use of image guidance during surgical procedures and the challenges posed by various imaging environments and how they relate to the design and development of robotic systems as well as their clinical applications. This volume also has significant contributions from the clinical viewpoint on some of the challenges in the domain of image guided interventions. Finally the volume on Rehabilitation Robotics is dedicated to the state of the art of an emerging interdisciplinary field where robotics sensors and feedback are used in novel ways to relearn, improve or restore functional movements in humans. Volume 1 Minimally Invasive Surgical Robotics focuses on an area of robotic applications that was established in the late 1990s after the first robotics assisted minimally invasive surgical procedure. This area has since received significant attention from industry and researchers. The teleoperated and ergonomic features of these robotic systems for minimally invasive surgery MIS have been able to reduce or eliminate most of the drawbacks of conventional laparoscopic MIS. Robotics assisted MIS procedures have been conducted on over 3 million patients to date primarily in the areas of urology, gynecology and general surgery using the FDA approved da Vinci surgical system. The significant commercial and clinical success of the da Vinci system has resulted in substantial research activity in recent years to reduce invasiveness, increase dexterity, provide additional features such as image guidance and haptic feedback, reduce size and cost, increase portability and address specific clinical procedures. The area of robotic MIS is therefore in a state of rapid growth fueled by new developments in technologies such as continuum robotics, smart materials, sensing and actuation, and haptics, and teleoperation. An important need arising from the incorporation of robotic technology for surgery is that of training in the appropriate use of the technology and in the assessment of acquired skills. This volume covers the topics mentioned above in four sections. The first section gives an overview of the evolution and current state of the da Vinci system and clinical perspectives from three groups who use it on a regular basis. The second focuses on the research and describes a number of new developments in surgical robotics that are likely to be the basis for the next generation of robotic MIS systems. The third deals with two important aspects of surgical robotic systems: teleoperation and haptics, the sense of touch. Technology for implementing the latter in a clinical setting is still very much at the research stage. The fourth section focuses on surgical training and skills assessment necessitated by the novelty and complexity of the technologies involved and the need to provide reliable and efficient training and objective assessment in the use of robotic MIS systems. In Volume 2 Micro and Nano Robotics in Medicine a brief historical overview of the field of medical nanorobotics as well as the state of the art in the field is presented in the introductory chapter. It covers the various types of nanorobotic systems, their applications and future directions in this field. The volume is divided into three themes related to medical applications. The first theme describes the main challenges of microrobotic design for propulsion in vascular media. Such nanoscale robotic agents are envisioned to revolutionize medicine by enabling minimally invasive diagnostic and therapeutic procedures. To be useful nanorobots must be operated in complex biological fluids and tissues which are often difficult to penetrate. In this

section a collection of four papers review the potential medical applications of motile nanorobots catalytic based propelling agents biologically inspired microrobots and nanoscale bacteria enabled autonomous drug delivery systems The second theme relates to the use of micro and nanorobots inside the body for drug delivery and surgical applications A collection of six chapters is presented in this segment The first chapter reviews the different robot structures for three different types of surgery namely laparoscopy catheterization and ophthalmic surgery It highlights the progress of surgical microrobotics toward intracorporeally navigated mechanisms for ultra minimally invasive interventions Then the design of different magnetic actuation platforms used in micro and nanorobotics are described An overview of magnetic actuation based control methods for microrobots with eventually biomedical applications is also covered in this segment The third theme discusses the various nanomanipulation strategies that are currently used in biomedicine for cell characterization injection fusion and engineering In vitro 3D cell culture has received increasing attention since it has been discovered to provide a better simulation environment of in vivo cell growth Nowadays the rapid progress of robotic technology paves a new path for the highly controllable and flexible 3D cell assembly One chapter in this segment discusses the applications of micro nano robotic techniques for 3D cell culture using engineering approaches Because cell fusion is important in numerous biological events and applications such as tissue regeneration and cell reprogramming a chapter on robotic tweezers cell manipulation system to achieve precise laser induced cell fusion using optical trapping has been included in this volume Finally the segment ends with a chapter on the use of novel MEMS based characterization of micro scale tissues instead of mechanical characterization for cell lines studies Volume 3 Image guided Surgical Procedures and Interventions focuses on several aspects ranging from understanding the challenges and opportunities in this domain to imaging technologies to image guided robotic systems for clinical applications The volume includes several contributions in the area of imaging in the areas of X Ray fluoroscopy CT PET MR Imaging Ultrasound imaging and optical coherence tomography Ultrasound based diagnostics and therapeutics as well as ultrasound guided planning and navigation are also included in this volume in addition to multi modal imaging techniques and its applications to surgery and various interventions The application of multi modal imaging and fusion in the area of prostate biopsy is also covered Imaging modality compatible robotic systems sensors and actuator technologies for use in the MRI environment are also included in this work as is the development of the framework incorporating image guided modeling for surgery and intervention Finally there are several chapters in the clinical applications domain covering cochlear implant surgery neurosurgery breast biopsy prostate cancer treatment endovascular interventions neurovascular interventions robotic capsule endoscopy and MRI guided neurosurgical procedures and interventions Volume 4 Rehabilitation Robotics is dedicated to the state of the art of an emerging interdisciplinary field where robotics sensors and feedback are used in novel ways to relearn improve or restore functional movements in humans This volume attempts to cover a number of topics relevant to the field The first section addresses an important activity in our

daily lives walking where the neuromuscular system orchestrates the gait posture and balance. Conditions such as stroke, vestibular deficits or old age impair this important activity. Three chapters on robotic training, gait rehabilitation and cooperative orthoses describe the current works in the field to address this issue. The second section covers the significant advances in and novel designs of soft actuators and wearable systems that have emerged in the area of prosthetic lower limbs and ankles in recent years which offer potential for both rehabilitation and human augmentation. These are described in two chapters. The next section addresses an important emphasis in the field of medicine today that strives to bring rehabilitation out from the clinic into the home environment so that these medical aids are more readily available to users. The current state of the art in this field is described in a chapter. The last section focuses on rehab devices for the pediatric population. Their impairments are life long and rehabilitation robotics can have an even bigger impact during their lifespan. In recent years a number of new developments have been made to promote mobility, socialization and rehabilitation among the very young, the infants and toddlers. These aspects are summarized in two chapters of this volume.

Intelligent Medical Technologies and Biomedical Engineering: Tools and Applications

Shukla, Anupam, Tiwari, Ritu, 2010-06-30. Intelligent Medical Technologies and Biomedical Engineering Tools and Applications helps young researchers and developers understand the basics of the field while highlighting the various developments over the last several years. [Minimally Invasive Cancer Management](#) Frederick L. Greene, B. Todd Heniford, 2010-09-11. As minimal access approaches to cancer diagnosis, staging and therapy become more widely used, it is vital for general surgeons along with laparoscopists, surgical oncologists and medical oncologists to stay up to date. The editors, a team consisting of a renowned surgical oncologist and a laparoscopic specialist, aim to provide a resource for the practicing general surgeon using basic minimally invasive techniques. The book discusses diagnosis, including biopsy with microinstrumentation, staging and palliative and curative resection. Specific tumor sites are addressed, including esophagus, stomach, spleen, small bowel, pancreato-biliary, hepatic resection and colo-rectal resection. Minimally invasive approaches to the thoracic and retroperitoneal areas are included. The book provides a thorough overview of basic cancer biology, instrumentation and ultrasound. Additionally, Greene and Heniford explore controversial issues such as port site recurrence and the effect of pneumoperitoneum on the spread of cancer cells in the abdomen. Many photographs and line drawings, including 16 in full color, illustrate the principles discussed in the text. A must have for every practicing general surgeon, laparoscopic fellow and general surgery resident.

Training in Minimal Access Surgery Nader Francis, Abe Fingerhut, Roberto Bergamaschi, Roger Motson, 2015-08-11. This book provides a broad overview on training in Minimal Access Surgery with expert opinions from leaders in the field, clarifying the definitions and terminology related to competence and accreditation. It also provides expert advice on how to set up a training unit and explores the role and impact

of all types of simulations on training including virtual reality simulation How to design a competency based training curriculum in advanced laparoscopic surgery is also explored along with in depth examination of the role of assessment and competency based accreditation Training in Minimal Access Surgery is a valuable resource for all health care professionals who are involved in training and education in Minimal Access Surgery including trainers and supervisors There is well established and robust evidence to support the benefits of laparoscopic surgery in terms of better pain control fewer complications and shorter length of stay with an earlier return to work Hence there is now widespread adoption of laparoscopic techniques in many surgical specialties including colorectal and morbid obesity surgery across the world
