*Current Contents* Institute for Scientific Information (Philadelphia),2001 **Rethinking the Human Revolution** Paul Mellars,2007 Arising from a conference Rethinking the Human Revolution reconsiders all of the central issues in modern human behavioural cognitive biological and demographic origins in the light of new information and new theoretical perspectives which have emerged over the past twenty years of intensive research in this field The 34 papers cover topics ranging from the DNA and skeletal evidence for modern human origins in Africa through the archaeological evidence for the emergence of distinctively modern patterns of human behaviour and cognition to the various lines of evidence for the geographical dispersal patterns of biologically and behaviourally modern populations from their African origins throughout Asia Australasia and Europe over the past 60 000 years **Theology, Evolution and the Mind** Neil Spurway,2009 In pre scientific thought mind itself and its religious perceptions particularly were considered gifts from God injected into a previously created world of matter By contrast all the contributors to this book accept an evolutionary account of life mind and its religious dispositions However they hold more divergent views on the relation of mind to body and brain on the validity of those religious dispositions and on how far even Christ and his predicted Second Coming may be seen as aspects of the evolutionary process The seventeen contributions are rewritten and extended versions of papers first delivered at the annual conference of the UK TM's Science and Religion Forum held at Canterbury Christ Church College in Sept 2007 Though most speakers were British representatives from The Netherlands Jordan Zimbabwe and USA also contributed Invited individual chapters consider the general pattern of evolutionary thought arguing that it can make a major contribution to the maturation of theology archaeological evidence for the emergence of religion and the proposal that it was an inevitable phase in human evolution the contribution of religious concepts to the development of our species and the question whether that provides any ground for accepting them as true the unresolved debate whether mind is a separate entity from brain or a consequence of its activity and the melding of paleo anthropology with theology to provide an integrated account of humanity and its culmination in Christ Each of these papers is the subject of an individual expert response and they are all drawn together in an overview essay which concludes the first part of the book The second shorter part contains a selection from the papers contributed by registrants for the meeting Their topics are whether mathematics consists of truths discovered or thought forms developed by human minds ecological awareness as an evolutionary

development the neurobiology of freewill and sin an evolutionary perspective on holistic medicine and the impressive fruitfulness of juxtaposing neurophysiological and biblical concepts of the human body mind

**Handbook of Human Molecular Evolution, 2 Volume Set** David N. Cooper, Hildegard Kehler-Sawatzki, 2008-10-13 This splendid compendium will be the standard reference work for years to come a handbook to browse to consult to look things up in and to read with pleasure wonder and post Darwinian exhilaration Richard Dawkins This is a marvellous book It should be in every university library preferably in several copies and every reader of this journal should add it to their next grant application It really is that good I have already found this book to be invaluable For many years to come these two volumes will be the starting point for anyone wishing to find out about virtually any subject relating to human genetics Any scientist working on humans or other animals will find many things in these pages that will stimulate inform and inspire The authors editors and publishers are to be congratulated for their work order a copy now HUMAN GENETICS The publishers and editors deserve to be congratulated for publishing this major book which coincides with the 200th anniversary of the birth of Charles Darwin The book is well timed with biologists theologians and sociologists engaged in intense debate on the Darwinian Theory on the origin of species evolution and natural selection There is little doubt that this marvellous publication should be in the library of universities and academic institutions dealing with basic and applied biology research and education It will not be surprising if the individual academic or researcher decides to invest in this resource and enrich their personal collection of leading books in genetics and genomics GENOMIC MEDICINE A Unique Collection of High Quality Articles Derived from the Acclaimed Encyclopedia of Life Sciences The revolution in human molecular genetics which has taken place over the last three decades has yielded a wealth of information not only on the structure and function of our genes but also on gene expression mutation and polymorphic variation Over the last five years the focus has moved from genes to genomes Even though the annotation of our 30 000 genes is still in progress genome wide studies have already yielded abundant evidence for the signatures of past selection and adaptive evolution within human gene sequences Further the completion of the sequencing of the 3 billion base pair human genome coupled with the increasing availability of other vertebrate genome sequences has ushered in a new era of comparative genomics We are now able to identify many of the molecular events from the chromosomal level down to the single base pair that have occurred during vertebrate mammalian primate and hominid evolution Indeed the detailed comparison of the human and chimpanzee genomes has begun to reveal some of the genetic changes that have been involved in the development of human lineage specific traits We are thus acquiring the ability to ask searching questions about our origins about the demographic processes associated with the global radiation of humankind as well as some of the unique adaptations that make us human Evolutionary biology has become so broad that its impact may be felt across the spectrum of the biological sciences The aim of the Handbook of Human Molecular Evolution is relatively straightforward to bring together under the same cover the many and varied strands of our knowledge of human primate

vertebrate molecular evolution. Hence the 282 chapters that comprise this essential reference work have been thematically arranged into twelve sections covering the whole scope of research into human molecular evolution: General Concepts in Evolutionary Genetics, Mutation, Adaptation and Natural Selection, Evolutionary and Population Genetics, Human Evolution, Human Genome Evolution, Evolution of Human Gene Structure and Function, Evolution of Gene Expression, Mitochondrial Genome Evolution, Chromosomal Evolution, Comparative Genomics, Evolution and Disease Susceptibility, Analysis of Ancient DNA. This conceptual outline informed the selection of the chapters themselves and the connections between them. Some of these chapters are intended to be introductory, aimed at undergraduates and non-specialists. They provide basic information and a list of recommended further reading to encourage the reader to explore a topic in more depth. This approach helps the student reader progress from textbook material to primary literature. Some chapters are overviews that address topics of broad interest and importance while others focus on quite specialized topics. These chapters are written for postgraduate students and research workers; they contain more detailed information and key references allowing the reader to investigate a specific area in more depth. This format allows professionals to use the books as a quick reference source. The chapters are richly supplied with website information to allow access to relevant data sources over the internet. The self-contained, peer-reviewed articles in this unique handbook have been written by leading scientists in each field. Key topics include the evolution of enzyme function, the use of nucleic acid divergence as a molecular clock, the origin of non-functional or 'junk' DNA, the role of gene duplication in the emergence of novel gene function, and the identification of molecular changes responsible for various human characteristics, especially those pertaining to infection, cognition, disease and disease susceptibility. The *Handbook of Human Molecular Evolution* has adopted an integrated approach to the study of human evolution and seeks throughout to emphasize the interplay between molecular genetic concepts and principles on the one hand and information acquisition and interpretation on the other. In this way it is hoped that the documents of evolutionary history written into the fabric of our genome will become accessible to the widest possible audience.

**Human Evolution** Camilo José Cela  
Conde, Francisco José Ayala, 2007. This book is intended as a comprehensive overview of hominid evolution, synthesizing data and approaches from physical anthropology, genetics, archaeology, psychology and philosophy. Human evolution courses are now widespread and this book has the potential to satisfy the requirements of most, particularly at the advanced undergraduate and graduate level. It is based on a translation, albeit with substantial modification, of a successful Spanish language book.
