## **Neuroimaging Basic Science:**

Neuroimaging I Erin D. Bigler, 1996-09-30 Until recent advents in neuroimaging the brain had been inaccessible to in vivo visualization short of neurosurgical procedures or some unfortunate traumatic exposure It is a tribute to the early contributors to clinical neuroscience that through what by today's standards would be deemed extremely crude measurements advancements in understanding brain function were made For example the theories of higher cortical functions of the brain by Aleksandr Luria or Hans Lukas Teuber in the 1950s were essentially based on military subjects who sustained traumatic head wounds during World War II These researchers could inspect the patient and determine where penetrating entrance and exit wounds were on the head sometimes they had skull films to identify entrance and exit fracture wounds sometimes neurosurgical reports were available and Luria even had the opportunity to acutely examine some patients with exposed wounds Thus one would take whatever information might be available and infer what regions of the brain were involved but could never actually visualize the brain Of course this changed dramatically with the introduction of brain imaging in the 1970s but it really was not until the 1990s that analysis and image display technologies finally caught up with the basic brain imaging methods of computerized tomography CT and magnetic resonance imaging MRI **Cambridge**

Gertz,Th Arendt,1998-11-12 As human longevity continues to be extended so will the impact of age associated dementia on individual lives and society Alzheimer s disease as the most common cause of dementia in the elderly remains a sentinel problem and its underlying pathology is still poorly understood Available therapeutic strategies require

considerable refinement and the development of new therapeutic strategies need input from basic research. Thus continued efforts are necessary both to understand basic mechanisms of the condition and to achieve more powerful therapies. This volume brings together the reports of basic scientists and clinical investigators. The chapters provide a spectrum of information valuable for clinicians and scientists. This issue bridges the gap between laboratory work in basic science and the development of urgently needed therapeutic strategies. Areas presented are the molecular and cellular biology of the disease, pathogenetic mechanisms and potential therapeutic targets, genetics, risk factors, strategies of prevention and treatment as well as practical aspects of medical and social care for patients with Alzheimer's disease.
