**Statistical Pattern Recognition** Andrew R. Webb,Keith D. Copsey,2011-10-13 Statistical pattern recognition relates to the use of statistical techniques for analysing data measurements in order to extract information and make justified decisions It is a very active area of study and research which has seen many advances in recent years Applications such as data mining web searching multimedia data retrieval face recognition and cursive handwriting recognition all require robust and efficient pattern recognition techniques This third edition provides an introduction to statistical pattern theory and techniques with material drawn from a wide range of fields including the areas of engineering statistics computer science and the social sciences The book has been updated to cover new methods and applications and includes a wide range of techniques such as Bayesian methods neural networks support vector machines feature selection and feature reduction techniques Technical descriptions and motivations are provided and the techniques are illustrated using real examples Statistical Pattern Recognition 3rd Edition Provides a self contained introduction to statistical pattern recognition Includes new material presenting the analysis of complex networks Introduces readers to methods for Bayesian density estimation Presents descriptions of new applications in biometrics security finance and condition monitoring Provides descriptions and guidance for implementing techniques which will be invaluable to software engineers and developers seeking to develop real applications Describes mathematically the range of statistical pattern recognition techniques Presents a variety of exercises including more extensive computer projects The in depth technical descriptions make the book suitable for senior undergraduate and graduate students in statistics computer science and engineering Statistical

Pattern Recognition is also an excellent reference source for technical professionals Chapters have been arranged to facilitate implementation of the techniques by software engineers and developers in non statistical engineering fields [http://www.wiley.com/go/statistical\\_pattern\\_recognition](http://www.wiley.com/go/statistical_pattern_recognition)

**Terrain Aided Localisation of Autonomous Vehicles in Unstructured Environments** Rajmohan Madhavan, 2003-03-08 This thesis is concerned with the theoretical and practical development of reliable and robust localisation algorithms for autonomous land vehicles operating at high speeds in unstructured expansive and harsh environments Localisation is the ability of a vehicle to determine its position and orientation within an operating environment The need for such a localisation system is motivated by the requirement of developing autonomous vehicles in applications such as mining agriculture and cargo handling The main drivers in these applications are for safety efficiency and productivity The approach taken to the localisation problem in this thesis guarantees that the safety and reliability requirements imposed by such applications are achieved The approach also aims to minimise the engineering or modification of the environment such as adding artificial landmarks or other infrastructure This is a key driver in the practical implementation of a localisation algorithm In pursuit of these objectives this thesis makes the following principal contributions 1 The development of an Iterative Closest Point Extended Kalman Filter ICP EKF algorithm a map based iconic algorithm that utilises measurements from a scanning laser rangefinder to achieve localisation The ICP EKF algorithm entails the development of a map building algorithm The main attraction of the map based localisation algorithm is that it works directly on sensed data and thus does not require extraction and matching of features It also explicitly takes into account the uncertainty associated with measurements and has the ability to include measurements from a variety of different sensors 2 The development and implementation of an entropy based metric to evaluate the information content of measurements This metric facilitates the augmentation of landmarks to the ICP EKF algorithm thus guaranteeing reliable and robust localisation 3 The development and adaptation of a view invariant Curvature Scale Space CSS landmark extraction algorithm The algorithm is sufficiently robust to sensor noise and is capable of reliably detecting and extracting landmarks that are naturally present in the environment from laser rangefinder scans 4 The integration of the information metric and the CSS and ICP EKF algorithms to arrive at a unified localisation framework that uses measurements from both artificial and natural landmarks combined with dead reckoning sensors to deliver reliable vehicle position estimates The localisation framework developed is sufficiently generic to be used on a variety of other autonomous land vehicle systems This is demonstrated by its implementation using field data collected from three different trials on three different vehicles The first trial was carried out on a four wheel drive vehicle in an underground mine tunnel The second trial was conducted on a Load Haul Dump LHD truck in a test tunnel constructed to emulate an underground

mine The estimates of the proposed localisation algorithms are compared to the ground truth provided by an artificial landmark based localisation algorithm that uses bearing measurements from a laser To demonstrate the feasibility and reliability of both the natural landmark extraction and localisation algorithms these are also implemented on a utility vehicle in an outdoor area within the University s campus The results demonstrate the robustness of the proposed localisation algorithms in producing reliable and accurate position estimates for autonomous vehicles operating in a variety of unstructured domains

Significant progress in the development of artificial intelligence AI and its wider use in many interactive products are quickly transforming further areas of our life which results in the emergence of various new social phenomena Many countries have been making efforts to understand these phenomena and find answers on how to put the development of artificial intelligence on the right track to support the common good of people and societies These attempts require interdisciplinary actions covering not only science disciplines involved in the development of artificial intelligence and human computer interaction but also close cooperation between researchers and practitioners For this reason the main goal of the MIDI conference held on 9 10 12 2021 as a virtual event is to integrate two until recently independent fields of research in computer science broadly understood artificial intelligence and human technology interaction
