Mathematical Foundations of Deep Learning Models and Algorithms Konstantinos Spiliopoulos, Richard B. Sowers, Justin Sirignano, 2025-12-09 Deep learning uses multilayer neural networks to model complex data patterns. Large models with millions or even billions of parameters are trained on massive datasets. This approach has produced revolutionary advances in image text and speech recognition and also has potential applications in a range of other fields such as engineering finance mathematics and medicine. This book provides an introduction to the mathematical theory underpinning the recent advances in deep learning. Detailed derivations as well as mathematical proofs are presented for many of the models and optimization methods which are commonly used in machine learning and deep learning. Applications code and practical approaches to training models are also included. The book is designed for advanced undergraduates graduate students practitioners and researchers. Divided into two parts it begins with mathematical foundations before tackling advanced topics in approximation optimization and neural network training. Part 1 is written for a general audience including students in mathematics statistics computer science data science or engineering while select chapters in Part 2 present more advanced mathematical theory requiring familiarity with analysis probability and stochastic processes. Together they form an ideal foundation for an introductory course on the mathematics of deep learning. Thoughtfully designed

exercises and a companion website with code examples enhance both theoretical understanding and practical skills preparing readers to engage more deeply with this fastevolving field
