Numerical Analysis 2000 Vol 2 Interpolation And Extrapolation:

Algorithms for Approximation Armin Iske,Jeremy Levesley,2006-12-13 Approximation methods are vital in many challenging applications of computational science and engineering This is a collection of papers from world experts in a broad variety of relevant applications including pattern recognition machine learning multiscale modelling of fluid flow metrology geometric modelling tomography signal and image processing It documents recent theoretical developments which have lead to new trends in approximation it gives important computational aspects and multidisciplinary applications thus making it a perfect fit for graduate students and researchers in science and engineering who wish to understand and develop numerical algorithms for the solution of their specific problems An important feature of the book is that it brings together modern methods from statistics mathematical modelling and numerical simulation for the solution of relevant problems with a wide range of inherent scales Contributions of industrial mathematicians including representatives from Microsoft and Schlumberger foster the transfer of the latest approximation methods to real world applications

Interpolation and Extrapolation C. Brezinski,2000-12-20 homepage sac.camna2000/index.html Volume Set now available at special set price This volume is dedicated to two closely related subjects interpolation and extrapolation The papers can be divided into three categories historical papers survey papers and papers presenting new developments Interpolation is an old subject since as noticed in the paper by M Gasca and T Sauer the term was coined by John Wallis in 1655 Interpolation was the first technique for obtaining an approximation of a function Polynomial interpolation was then used in quadrature methods and methods for the numerical solution of ordinary differential equations Extrapolation is based on interpolation In fact extrapolation consists of interpolation at a point outside the interval containing the interpolation points Usually this point is either zero or infinity Extrapolation is used in numerical analysis to improve the accuracy of a process depending of a parameter or to accelerate the convergence of a sequence The most well known extrapolation processes are certainly Romberg's method for improving the convergence of the trapezoidal

rule for the computation of a definite integral and Aiken's 2 process which can be found in any textbook of numerical analysis
Obviously all aspects of interpolation and extrapolation have not been treated in this volume However many important topics
