LEAST SQUARES REGRESSION

Goal: Minimize the sum of the squares of the residuals (errors).

Residual = $y_i - \hat{y}_i$

Sum of Squares = $\sum (y_i - \hat{y}_i)^2$

Minimize: $\sum (y_i - \hat{y}_i)^2$

$$S_0 = \sum_{i=1}^n y_i^2 - \frac{(\sum y_i)^2}{n}$$

POLYNOMIAL QUADRATIC REGRESSION

$$S_0 = \sum_{i=1}^n (y_i - a_0 - a_1 x_i - a_2 x_i^2)^2$$

$$\frac{\partial S_0}{\partial a_2} = -2 \sum x_i^2 (y_i - a_0 - a_1 x_i - a_2 x_i^2) = 0$$

Harold J. Kushner, Paul G. Dupuis

Numerical Methods And Stochastics:

Numerical Methods and Stochastics T. J. Lyons, Thomas Stephenson Salisbury, This volume represents the proceedings of the Workshop on Numerical Methods and Stochastics held at The Fields Institute in April 1999 The goal of the workshop was to identify emerging ideas in probability theory that influence future work in both probability and numerical computation The book focuses on new results and gives novel approaches to computational problems based on the latest techniques from the theory of probability and stochastic processes Three papers discuss particle system approximations to solutions of the stochastic filtering problem Two papers treat particle system equations The paper on rough paths describes how to generate good approximations to stochastic integrals An expository paper discusses a long standing conjecture the stochastic fastdynamo effect A final paper gives an analysis of the error in binomial and trinomial approximations to solutions of the Black Scholes stochastic differential equations The book is intended for graduate students and research mathematicians interested in probability theory

Numerical Methods for Stochastic Control Problems in Continuous Time Harold Kushner, Paul G. Dupuis, 2013-11-27 Changes in the second edition The second edition differs from the first in that there is a full development of problems where the variance of the diffusion term and the jump distribution can be controlled Also a great deal of new material concerning deterministic problems has been added including very efficient algorithms for a class of problems of wide current interest This book is concerned with numerical methods for stochastic control and optimal stochastic control problems The random process models of the controlled or uncontrolled stochastic systems are either diffusions or jump diffusions Stochastic control is a very active area of research and new problem formulations and sometimes surprising applications appear regularly We have chosen forms of the models which cover the great bulk of the formulations of the continuous time stochastic control problems which have appeared to date The standard formats are covered but much emphasis is given to the newer and less well known formulations The controlled process might be either stopped or absorbed on leaving a constraint set or upon first hitting a target set or it might be reflected or projected from the boundary of a constraining set In some of the more recent applications of the reflecting boundary problem for example the so called heavy traffic approximation problems the directions of reflection are actually discontinuous In general the control might be representable as a bounded function or it might be of the so called impulsive or singular control types

Numerical Solution of Stochastic Differential Equations Peter E. Kloeden, Eckhard Platen, 2013-04-17 The aim of this book is to provide an accessible introduction to stochastic differential equations and their applications together with a systematic presentation of methods available for their numerical solution During the past decade there has been an accelerating interest in the development of numerical methods for stochastic differential equations SDEs This activity has been as strong in the engineering and physical sciences as it has in mathematics resulting inevitably in some duplication of effort due to an unfamiliarity with the developments in other disciplines Much of the reported work has been motivated by the need to solve particular types of problems for which even more so than in the deterministic context specific methods are required The treatment has often been heuristic and ad hoc in character Nevertheless there are underlying principles present in many of the papers an understanding of which will enable one to develop or apply appropriate numerical schemes for particular problems or classes of problems

Numerical Methods for Stochastic Control Problems in Continuous Time Harold J. Kushner, Paul G. Dupuis, 2012 The book presents a comprehensive development of effective numerical methods for stochastic control problems in continuous time The process models are diffusions jump diffusions or reflected diffusions of the type that occur in the majority of current applications All the usual problem formulations are included as well as those of more recent interest such as ergodic control singular control and the types of reflected diffusions used as models of queuing networks Convergence of the numerical approximations is proved via the efficient probabilistic methods of weak convergence theory The methods also apply to the calculation of functionals of uncontrolled processes and for the approximation to optimal nonlinear filters as well Applications to complex deterministic problems are illustrated via application to a large class of problems from the calculus of variations The general approach is known as the Markov Chain Approximation Method Essentially all that is required of the approximations are some natural local consistency conditions The approximations are consistent with standard methods of numerical analysis The required background in stochastic processes is surveyed there is an extensive development of methods of approximation and a chapter is devoted to computational techniques The book is written on two levels that of practice algorithms and applications and that of the mathematical development Thus the methods and use should be broadly accessible
