Nutrition In The Infant:

Infant Nutrition B. A. Rolls, Ann Walker, 2013-11-11 Few people doubt that the mother's milk provides the best food for the full term infant during the first few months of life when the digestive absorptive and excretory systems are relatively immature. The development of the digestive enzymes is detailed in Chapter 4. The significance of this immaturity first emerged as a consequence of the pioneering work of Professor Robert McCance and Dr Elsie Widdowson in human nutrition when they studied the electrolyte and nitrogen excretion of babies and young animals. To quote Professor McCance: 'Inefficient though the kidneys were by adult standards they were capable of maintaining homeostasis provided the infant and animals were growing while being fed on food of exactly the right composition that is the milk of the mother.' Ashwell, 1993. One should not forget that although the mother protects the developing baby against much nutritional abuse the baby may be still be affected by maternal nutrition and this is discussed in Chapter 2. The superior qualities of breast milk are still recognized and research continues to discover yet more factors in breast milk significant to the health of the baby for possible inclusion in formulas. The immature stage of development of the baby means that while enough nutrients for optimal growth of all tissues are required excessive quantities may cause intoxication. Tight specifications are essential since unlike the adult the newborn depends on a single food.

Nutrition of Normal Infants Samuel J. Fomon, 1993 Assembles and interprets information relevant to growth and nutrition of normal term infants in industrialized countries. Discusses such topics as infant feeding and evolution trends in infant feeding since 1950, size and growth, estimated requirements and recommended dietary intakes, water and renal solute load, vitamins, minerals, micronutrients, human milk and breast feeding, infant formulas, cow milk and beikost recommendations for feeding normal infants etc.

Clinical Perspective Karol Prosser, 2023-09-19 Infancy is the time of rapid growth after the fetal period. This stage of life requires optimized nutrition in order to achieve proper growth and organ development. The amount of nutrition needed to support and maintain adequate growth and optimal health while maintaining homeostasis with other nutrients is determined by the individual requirements of infants. Nutritional needs differ during infancy and growth patterns are directly related to optimal nutrition. In the first six months, breast milk is the best source of nutrition for infants. Human milk may have particular advantages for premature infants due to the interrelationships between host defense, nutritional support, and gastrointestinal development. Carbohydrates and protein, folate, calcium, zinc, fat, and iron are a few of the nutrients that infants require to grow and stay healthy. This book unravels the recent studies on the role of nutrition in newborn and infant health. It consists of contributions made by international experts. The extensive content of this book provides the readers with a thorough understanding of the subject.
