## **Numerical Methods Of Reactor Analysis:**

*Numerical Methods of Reactor Analysis* Melville Jr. Clark, 2012-12-02 Nuclear Science and Technology Volume 3  
Numerical Methods of Reactor Analysis presents the numerical analysis frequently used in the nuclear reactor field. This book discusses the numerical approximation for the multigroup diffusion method which results in simple algebraic equations. Organized into six chapters this volume starts with an overview of the simplified formulation of linear algebra by defining the matrices and operations with matrices. This text then discusses the properties of special matrices and reviews the elementary properties of finite difference equations. Other chapters consider a variety of methods of obtaining numerical solutions to the approximating equations. The final chapter deals with Monte Carlo method which is a statistical method for solving statistical or deterministic problems. This book is a valuable resource for nuclear engineers. Students at the graduate level who had an introductory course in reactor physics and a basic course in differential equations will also find this book useful.

## **High Resolution Numerical Methods for Coupled Non-linear Multi-physics Simulations with Applications in Reactor Analysis** Vijay Subramaniam

Mahadevan, 2011 The modeling of nuclear reactors involves the solution of a multi physics problem with widely varying time and length scales. This translates mathematically to solving a system of coupled non linear and stiff partial differential equations PDEs. Multi physics applications possess the added complexity that most of the solution fields participate in various physics components potentially yielding spatial and or temporal coupling errors. This dissertation deals with the verification aspects associated with such a multi physics code i.e. the substantiation that the mathematical description of the multi physics equations are solved correctly both in time and space. Conventional paradigms used in reactor analysis problems employed to couple various physics components are often non iterative and can be inconsistent in their treatment of the non linear terms. This leads to the usage of smaller time steps to maintain stability and accuracy requirements thereby increasing the overall computational time for simulation. The inconsistencies of these weakly coupled solution methods can be overcome using tighter coupling strategies and yield a better approximation to the coupled non linear operator by resolving the dominant spatial and temporal scales involved in the multi physics simulation. A multi physics framework KARMA K code for Analysis of Reactor and other Multi physics Applications is presented. KARMA uses tight coupling strategies for various physical models based on a Matrix free Nonlinear Krylov MFNK framework in order to attain high order spatio temporal accuracy for all solution fields in amenable wall clock times for various test problems. The framework also utilizes traditional loosely coupled methods as lower order solvers which serve as efficient preconditioners for the tightly coupled solution. Since

the software platform employs both lower and higher order coupling strategies it can easily be used to test and evaluate different coupling strategies and numerical methods and to compare their efficiency for problems of interest Multi physics code verification efforts pertaining to reactor applications are described and associated numerical results obtained using the developed multi physics framework are provided The versatility of numerical methods used here for coupled problems and feasibility of general non linear solvers with appropriate physics based preconditioners in the KARMA framework offer significantly efficient techniques to solve multi physics problems in reactor analysis
