Warnatz,2007-05-31 The articles in this volume summarize the research results obtained in the former SFB 359 Reactive Flow Diffusion and

Transport which has been supported by the DFG over the period 1993-2004. The main subjects are physical chemical processes sharing the difficulty of interacting diffusion, transport and reaction which cannot be considered separately. Typical examples are the chemical processes in flow reactors and in the catalytic combustion at surfaces. Further examples are models of star formation including diffusive mass transport, energy radiation and dust formation and the polluting transport in soil and waters. For these complex processes mathematical models are established and numerically simulated. The modeling uses multiscale techniques for nonlinear differential equations while for the numerical simulation and optimization goal oriented mesh and model adaptivity, multigrid techniques and advanced Newton type methods are developed combined with parallelization. This modeling and simulation is accompanied by experiments.

Computational Fluid Dynamics T. J. Chung, 2002-02-07. Increasingly computational fluid dynamics (CFD) techniques are being used to study and solve complex fluid flow and heat transfer problems. This comprehensive book ranges from elementary concepts for the beginner to state of the art CFD for the practitioner. It begins with CFD preliminaries in which the basic principles of finite difference (FD), finite element (FE) and finite volume (FV) methods are discussed and illustrated through examples with step by step hand calculations. Then FD and FE methods respectively are covered including both historical developments and recent contributions. The next section is devoted to structured and unstructured grids, adaptive methods, computing techniques and parallel processing. Finally the author describes a variety of practical applications to problems in turbulence, reacting flows and combustion, acoustics, combined mode radiative heat transfer, multiphase flows, electromagnetic fields and relativistic astrophysical flows. Students and practitioners particularly in mechanical, aerospace, chemical and civil engineering will use this authoritative text to learn about and apply numerical techniques to the solution of fluid dynamics problems.

Bridging Scales in Modelling and Simulation of Non-Reacting and Reacting Flows. Part I, 2018-03-27. Bridging Scales in Modelling and Simulating Reacting Flows. Part I. Volume 52 presents key methods to bridge scales in the simulation of reacting single phase flows. New sections in the updated release include topics such as quadrature based moment methods for multiphase chemically reacting flows, the collaboration of experiments and simulations for the development of predictive models, a simulation of turbulent coalescence and breakage of bubbles and droplets in the presence of surfactants, a section on salts and contaminants and information on the numerical simulation of reactive flows. Contains reviews by leading authorities in their respective areas. Presents up to date reviews of the latest techniques in the modeling of catalytic processes. Includes a broad mix of US and European authors as well as academic, industrial and research institute perspectives. Provides discussions on the connections between computational and experimental methods.

Numerical Simulation of Compressible Reactive Flows Bing Wang, 2016. Numerical simulation has been widely employed to investigate the compressible flows since it is difficult to carry out the experimental measurements especially in the reactive flows. The shock wave capturing scheme will be necessary for resolving the compressible flows and moreover the careful treatments of chemical reaction should be considered for

proceeding numerical simulation stable and fast Recently the present authors have tried to establish a high resolution numerical solver for computing the compressible reactive flows This chapter presents the numerical procedures acquired in this solver for computing the fluxes using weighted essentially non oscillatory WENO scheme dealing with chemical stiffness problems and tracing droplets and their interaction with the compressible fluids As examples the Taylor Green vortex TGV problem considering the passive scalar mixing the spatially developing reactive mixing layer flows taken gas phase hydrogen and liquid n decane as fuel are simulated respectively Many important characteristics of flow flame and ignition are analyzed under the supersonic condition
