Abstract: For safe path planning of unmanned aerial vehicles (UAVs) in a three-dimensional (3D) environment with multiple threats, first, a cost function is introduced according to the terrain constraints and UAV overall performance constraints of the path planning problem. Then, improved nonlinear dynamic inertia weights (INNDIW) are introduced into the particle swarm optimization (PSO) algorithm, and when the particles fall into the local optimum, the velocity is perturbed, and the velocity and improved nonlinear dynamic inertia weight PSO (VAINNDIWPSO) algorithm are obtained. The algorithm improves the speed of convergence and fitness function value of the PSO algorithm. However, the impact of flyable path optimization is now not obvious. Therefore, to further enhance the overall performance of the VAINNDIWPSO algorithm, the adaptive adjustment of the velocity is introduced, the chaotic initialization is carried out, and the improved logistic chaotic map is introduced into the algorithm, and an improved chaotic-VAINNDIWPSO (C-VAINNDIWPSO) algorithm is obtained. Then, the corresponding relationship between the algorithm and constraints is used to efficiently search complicated environments and find paths with excessive security and small cost function. The simulation outcomes exhibit that in a complicated environment the C-VAINNDIWPSO algorithm substantially improves the speed of convergence of the algorithm, reduces the fitness function value of the algorithm and the initialization time of the algorithm, and the acquired path is additionally smoother. A near-optimal solution is obtained.

1. Introduction

UAVs have the advantages of top maneuverability, robust battlefield adaptability, small size, and low cost and are extensively used in military and civilian missions, such as surveillance, reconnaissance operations, search and rescue, emergency communications, and agriculture. The secure path planning of UAVs is of excellent magnitude to the completion rate and efficiency of UAVs performing tasks. Path planning [1,2] refers to calculating the optimal path between the beginning point and the goal point based on totally satisfying the constraints of the UAV itself and exterior threats. UAV secure path planning performs a key function in enhancing the autonomy and intelligence level of unmanned systems, so research on this topic has received greater and greater attention.

For the path planning issue of UAVs or robots, domestic and international scholars have proposed many techniques [3–7], such as the A^* algorithm [8], the rapidly exploring random tree [9], the probabilistic roadmap algorithm [10], the Voronoi diagram algorithm [11], etc. However, these algorithms ignore the dynamics and kinematic constraints of UAVs, so they typically cannot be utilized in practical situations. The potential field methods, such as the artificial potential field method [12] and the interfered fluid dynamical system algorithm are additional superb techniques for path planning [13]. However,

Nonlinear Dynamics and Entropy of Complex Systems with Hidden and Self-excited Attractors

Christos Volos,Sajad Jafari,Jacques Kengne,Jesus M. Munoz-Pacheco,Karthikeyan Rajagopal,2019-05-03 In recent years entropy has been used as a measure of the degree of chaos in dynamical systems Thus it is important to study entropy in nonlinear systems Moreover there has been increasing interest in the last few years regarding the novel classification of nonlinear dynamical systems including two kinds of attractors self excited attractors and hidden attractors The localization of self excited attractors by applying a standard computational procedure is straightforward In systems with hidden attractors however a specific computational procedure must be developed since equilibrium points do not help in the localization of hidden attractors Some examples of this kind of system are chaotic dynamical systems with no equilibrium points with only stable equilibria curves of equilibria and surfaces of equilibria and with non hyperbolic equilibria There is evidence that hidden attractors play a vital role in various fields ranging from phase locked loops oscillators describing convective fluid motion drilling systems information theory cryptography and multilevel DC DC converters This Special Issue is a collection of the latest scientific trends on the advanced topics of dynamics entropy fractional order calculus and applications in complex systems with self excited attractors and hidden attractors
