Optics Of Femtosecond Laser Pulses:

Femtosecond Laser Pulses Claude Rulliere, 2007-05-27 This is the second edition of this advanced textbook written for scientists who require further training in femtosecond science Four years after publication of the first edition femtosecond science has overcome new challenges and new applications have become mature It is necessary to take into account these new developments Two main topics merged during this period that support important scientific activities attosecond pulses are now generated in the X UV spectral domain and coherent control of chemical events is now possible by tailoring the shape of femtosecond pulses To update this advanced textbook it was necessary to introduce these fields two new chapters are in this second edition Coherent Control in Atoms Molecules and Solids Chap 11 and Attosecond Pulses Chap 12 with well documented references Some changes addenda and new references are introduced in the first edition's ten original chapters to take into account new developments and update this advanced textbook which is the result of a scientific adventure that started in 1991 At that time the French Ministry of Education decided that in view of the growing importance of ultrashort laser pulses for the national scientific community a Femtosecond Centre should be created in France and devoted to the further education of scientists who use femtosecond pulses as a research tool and who are not specialists in lasers or even in optics

Femtosecond Laser Filamentation See Leang Chin, 2010-03-10 This book attempts to give a discussion of the physics and current and potential applications of the self focusing of an intense femtosecond laser pulse in a transparent medium Although self focusing is an old subject of nonlinear optics the consequence of self focusing of intense femtosecond laser pulses is totally new and unexpected Thus new phenomena are observed such as

long range lasing intensity clamping white light laser pulse self spatial filtering self group phase locking self pulse compression clean nonlinear fluorescence and so on Long range propagation at high intensity which is seemingly against the law of diffraction is probably one of the most exciting consequences of this new sub field of nonlinear optics Because the intensity inside the filament core is high new ways of doing nonlinear optics inside the filament become possible We call this filamentation nonlinear optics We shall describe the generation of pulses at other wavelengths in the visible and ultraviolet UV starting from the near infrared pump pulse at 800 nm through four wave mixing and third harmonic generation all in gases Remotely sensing fluorescence from the fragments of chemical and biological agents in all forms gaseous aerosol or solid inside the filaments in air is demonstrated in the laboratory The results will be shown in the last part of the book Through analyzing the fluorescence of gas molecules inside the filament an unexpected physical process pertaining to the interaction of synchrotron radiation with molecules is observed

Femtosecond Laser Spectroscopy Peter Hannaford, 2004-10-29 The embryonic development of femtoscience stems from advances made in the generation of ultrashort laser pulses Beginning with mode locking of glass lasers in the 1960s the development of dye lasers brought the pulse width down from picoseconds to femtoseconds The breakthrough in solid state laser pulse generation provided the current reliable table top laser systems capable of average power of about 1 watt and peak power density of easily watts per square centimeter with pulse widths in the range of four to eight femtoseconds Pulses with peak power density reaching watts per square centimeter have been achieved in laboratory settings and more recently pulses of sub femtosecond duration have been successfully generated As concepts and methodologies have evolved over the past two decades the realm of ultrafast science has become vast and exciting and has impacted many areas of chemistry biology and physics and other fields such as materials science electrical engineering and optical communication In molecular science the explosive growth of this research is for fundamental reasons In femtochemistry and femtobiology chemical bonds form and break on the femtosecond time scale and on this scale of time we can freeze the transition states at configurations never before seen Even for a reactive physical changes one is observing the most elementary of molecular processes On a time scale shorter than the vibrational and rotational periods the ensemble behaves coherently as a single molecule trajectory

Femtosecond-Scale Optics Dong Chin Sun, 2016-04-01 A femtosecond laser is

a laser which emits optical pulses with a duration well below 1 ps ultrashort pulses i.e. in the domain of femtoseconds. It thus also belongs to the category of ultrafast lasers or ultrashort pulse lasers. The generation of such short pulses is nearly always achieved with the technique of passive mode locking. The growth of the femtosecond duration range is certainly one of the most brilliant achievements of laser physics. With progress in ultrashort ultraintense laser technologies the peak power of a laser pulse increases year by year. These new instruments accessible to a large community of researchers revolutionized experiments in nonlinear optics because when laser pulse intensity exceeds or even approaches intra atomic field strength the new physical picture of light-matter interaction appears. Laser radiation is efficiently transformed into fluxes of charged or neutral particles and the very wide band of electromagnetic emission from THz up to x-rays is observed. Ultrashort laser pulses with durations approaching the timescales of fundamental atomic and molecular processes are useful in a range of scientific disciplines. They deliver energy so quickly that new processes and observations are possible. Their short duration allows them to probe delicate living structures without destroying them and make material modifications on the micron scale with minimal or precisely controllable heat effects. This field of researches is in rapid progress now. Femtosecond Scale Optics provides depictions of current developments and original results in some specific areas of this very wide scientific field. This text will be of interest for those specialized in the subject of laser-matter interactions. Femtosecond Technology for Technical and Medical Applications Friedrich Dausinger, Friedemann Lichtner, Holger Lubatschowski, 2004-10-14. A comprehensive overview of the principles and applications of femtosecond lasers especially applied to medicine and to production technology. The advantages and problems of ultrashort laser pulses are discussed in more detail in the context of applications in the micro-machining of technical materials such as drilling, surface structuring and cutting in medical use like dental, ophthalmologic, neurologic and otolaryngologic applications in metrology and in the generation of x-rays. Safety aspects are also considered. *Femtosecond Laser Shaping* Marcos Dantus, 2017-08-03. Expensive, delicate and difficult to operate femtosecond lasers have already won two Nobel Prizes and created multi-billion-dollar industries. As these lasers break out of laboratories for use in real-world large-scale applications the number of people using them increases. This book provides a fresh perspective on femtosecond lasers discussing how they are soon to become a universal light source spanning any timescale and generating any wavelength of light. Starting from the basics of light itself this book presents in an everyday manner with clear illustrations and without formulas what makes this class of lasers so versatile and the future of many more applications. Many of the subjects covered in this book are described in plain words for the first time. Fundamentals of Attosecond Optics Zenghu Chang, 2016-04-19. Attosecond optical pulse generation along with the related process of high-order harmonic generation is redefining ultrafast physics and chemistry. A practical understanding of attosecond optics requires significant background information and foundational theory to make full use of these cutting-edge lasers and advance the technology toward the next generation.
