Ulrich Derigs, 2013-11-11 Network flow and matching are often treated separately in the literature and for each class a variety of different algorithms has been developed. These algorithms are usually classified as primal dual primal dual etc.

The question the author addresses in this work is that of the existence of a common combinatorial principle which might be inherent in all those apparently different approaches. It is shown that all common network flow and matching algorithms implicitly follow the so called shortest augmenting path. This can be interpreted as a greedy like decision rule where the optimal solution is built up through a sequence of local optimal solutions. The efficiency of this approach is realized by combining this myopic decision rule with an anticipant organization. The approach of this work is organized as follows. For several standard flow and matching problems the common solution procedures are first reviewed. It is then shown that they all reduce to a common basic principle that is they all perform the same computational steps if certain conditions are set properly and ties are broken according to a common rule. Recognizing this near equivalence of all commonly used algorithms the question of the best method has to be modified all methods are only different implementations of the same algorithm obtained by different views of the problem

Graphs, Networks and Algorithms Dieter Jungnickel, 2012-11-08

From the reviews of the previous editions The book is a first class textbook and seems to be indispensable for everybody who has to teach combinatorial optimization. It is very helpful for students teachers and researchers in this area. The author finds a

striking synthesis of nice and interesting mathematical results and practical applications the author pays much attention to the inclusion of well chosen exercises. The reader does not remain helpless solutions or at least hints are given in the appendix. Except for some small basic mathematical and algorithmic knowledge the book is self contained. K Engel Mathematical Reviews 2002 The substantial development effort of this text involving multiple editions and trailing in the context of various workshops university courses and seminar series clearly shows through in this new edition with its clear

writing good organisation comprehensive coverage of essential theory and well chosen applications The proofs of important results and the representation of key algorithms in a Pascal like notation allow this book to be used in a high level undergraduate or low level graduate course on graph theory combinatorial optimization or computer science algorithms The well worked solutions to exercises are a real bonus for self study by students The book is highly recommended P B Gibbons Zentralblatt f r Mathematik 2005 Once again the new edition has been thoroughly revised In particular some further material has been added more on NP completeness especially on dominating sets a section on the Gallai Edmonds structure theory for matchings and about a dozen additional exercises as always with solutions Moreover the section on the 1 factor theorem has been completely rewritten it now presents a short direct proof for the more general Berge Tutte formula Several recent research developments are discussed and quite a few references have been added

This book presents open optimization problems in graph theory and networks Each chapter reflects developments in theory and applications based on Gregory Gutin's fundamental contributions to advanced methods and techniques in combinatorial optimization. Researchers, students, and engineers in computer science, big data, applied mathematics, operations research, algorithm design, artificial intelligence, software engineering, data analysis, industrial and systems engineering will benefit from the state of the art results presented in modern graph theory and its applications to the design of efficient algorithms for optimization problems. Topics covered in this work include Algorithmic aspects of problems with disjoint cycles in graphs, Graphs where maximal cliques and stable sets intersect, The maximum independent set problem with special classes, A general technique for heuristic algorithms for optimization problems, The network design problem with cut constraints, Algorithms for computing the frustration index of a signed graph, A heuristic approach for studying the patrol problem on a graph, Minimum possible sum and product of the proper connection number, Structural and algorithmic results on branchings in digraphs, Improved upper bounds for Korkel-Ghosh benchmark SPLP instances. *Combinatorial Optimization and Graph Algorithms* Takuro Fukunaga, Ken-ichi Kawarabayashi, 2017-10-02. Covering network designs, discrete convex analysis, facility location and clustering problems, matching games and parameterized complexity, this book discusses theoretical aspects of combinatorial optimization and graph algorithms. Contributions are by renowned researchers who attended NII Shonan meetings on this essential topic. The collection contained here provides readers with the outcome of the authors' research and productive meetings on this dynamic area, ranging from computer science and mathematics to operations research. Networks are ubiquitous in today's world: the Web, online social networks, and search and query click logs can lead to a graph that consists of vertices and edges. Such networks are growing so fast that it is essential to design algorithms to work for these large networks. Graph algorithms comprise an area in computer science that works to design efficient algorithms for networks. Here one can work on theoretical or practical problems where implementation of an algorithm for large networks is needed. In two of the chapters, recent results in graph matching games and fixed parameter tractability are surveyed. Combinatorial optimization is an intersection of operations research and mathematics, especially discrete mathematics, which deals with new questions and new problems attempting to find an optimum object from a finite set of objects. Most problems in combinatorial optimization are not tractable, i.e., NP hard. Therefore, it is necessary to design an approximation algorithm for them. To tackle these problems requires the development and combination of ideas and techniques from diverse mathematical areas, including complexity theory, algorithm theory, and matroids, as well as graph theory, combinatorics, convex and nonlinear optimization, and discrete and convex geometry. Overall, the book presents recent progress in facility location, network design, and discrete convex analysis. *Graphs and Algorithms in Communication Networks* Arie Koster, Xavier

Muñoz,2009-12-01 Algorithmic discrete mathematics plays a key role in the development of information and communication technologies and methods that arise in computer science mathematics and operations research in particular in algorithms computational complexity distributed computing and optimization are vital to modern services such as mobile telephony online banking and VoIP This book examines communication networking from a mathematical viewpoint The contributing authors took part in the European COST action 293 a four year program of multidisciplinary research on this subject In this book they offer introductory overviews and state of the art assessments of current and future research in the fields of broadband optical wireless and ad hoc networks Particular topics of interest are design optimization robustness and energy consumption The book will be of interest to graduate students researchers and practitioners in the areas of networking theoretical computer science operations research distributed computing and mathematics
