**Computational Optimization, Methods and Algorithms** Slawomir Koziel,Xin-She Yang,2011-06-17 Computational optimization is an important paradigm with a wide range of applications In virtually all branches of engineering and industry we almost always try to optimize something whether to minimize the cost and energy consumption or to maximize profits outputs performance and efficiency In many cases this search for optimality is challenging either because of the high computational cost of evaluating objectives and constraints or because of the nonlinearity multimodality discontinuity and uncertainty of the problem functions in the real world systems Another complication is that most problems are often NP hard that is the solution time for finding the optimum increases exponentially with the problem size The development of efficient algorithms and specialized techniques that address these difficulties is of primary importance for contemporary engineering science and industry This book consists of 12 self contained chapters contributed from worldwide experts who are working in these exciting areas The book strives to review and discuss the latest developments concerning optimization and modelling with a focus on methods and algorithms for computational optimization It also covers well chosen real world applications in science engineering and industry Main topics include derivative free optimization multi objective evolutionary algorithms surrogate based methods maximum simulated likelihood estimation support vector machines and metaheuristic algorithms Application case studies include aerodynamic shape optimization microwave engineering black box optimization classification economics inventory optimization and structural optimization This graduate level book can serve as an excellent reference for lecturers

researchers and students in computational science engineering and industry      **Safety and performance concept.**

**Reliability assessment of concrete structures** fib Fédération internationale du béton, 2018-08-01 Concrete structures have been built for more than 100 years At first reinforced concrete was used for buildings and bridges even for those with large spans Lack of methods for structural analysis led to conservative and reliable design Application of prestressed concrete started in the 40s and strongly developed in the 60s The spans of bridges and other structures like halls industrial structures stands etc grew significantly larger At that time the knowledge of material behaviour durability and overall structural performance was substantially less developed than it is today In many countries statically determined systems with a fragile behavior were designed for cast in situ as well as precast structures Lack of redundancy resulted in a low level of robustness in structural systems In addition the technical level of individual technologies e g grouting of prestressed cables was lower than it is today The number of concrete structures including prestressed ones is extremely high Over time and with increased loading the necessity of maintaining safety and performance parameters is impossible without careful maintenance smaller interventions strengthening and even larger reconstructions Although some claim that unsatisfactory structures should be replaced by new ones it is often impossible as authorities in general have only limited resources Most structures have to remain in service probably even longer than initially expected In order to keep the existing concrete structures in an acceptable condition the development of methods for monitoring inspection and assessment structural identification nonlinear analysis life cycle evaluation and safety and prediction of the future behaviour etc is necessary The scatter of individual input parameters must be considered as a whole This requires probabilistic approaches to individual partial problems and to the overall analysis The members of the fib Task Group 2.8 Safety and performance concepts wrote on the basis of the actual knowledge and experience a comprehensive document that provides crucial knowledge for existing structures which is also applicable to new structures This guide to good practice is divided into 10 basic chapters dealing with individual issues that are critical for activities associated with preferably existing concrete structures Bulletin 86 starts with the specification of the performance based requirements during the entire lifecycle The risk issues are described in chapter two An extensive part is devoted to structural reliability including practical engineering approaches and reliability assessment of existing structures Safety concepts for design consider the lifetime of structures and summarise safety formats from simple partial safety factors to develop approaches suitable for application in sophisticated probabilistic non linear analyses Testing for design and the determination of design values from the tests is an extremely important issue This is especially true for the evaluation of existing structures Inspection and monitoring of existing structures are essential for maintenance for the prediction of remaining service life and for the planning of interventions Chapter nine presents probabilistically based models for material degradation processes Finally case studies are presented in chapter ten The results of the concrete structures monitoring as well as their application for assessment and prediction of their future

behaviour are shown The risk analysis of highway bridges was based on extensive monitoring and numerical evaluation programs Case studies perfectly illustrate the application of the methods presented in the Bulletin The information provided in this guide is very useful for practitioners and scientists It provides the reader with general procedures from the specification of requirements monitoring assessment to the prediction of the structures lifecycles However one must have a sufficiently large amount of experimental and other data e g construction experience in order to use these methods correctly This data finally allows for a statistical evaluation As it is shown in case studies extensive monitoring programs are necessary The publication of this guide and other documents developed within the fib will hopefully help convince the authorities responsible for safe and fluent traffic on bridges and other structures that the costs spent in monitoring are first rather small and second they will repay in the form of a serious assessment providing necessary information for decision about maintenance and future of important structures

would have reflected the range of systems applications to civil engineering problems considered by the Institute These volumes therefore reflect the full range of these problems including structural analysis and design water resources engineering geotechnical engineering transportation and environmental engineering      **Recent Advances in Engineering Mechanics and Their Impact on Civil Engineering Practice** Wai-Fah Chen,A.
