Optimization On Low Rank Nonconvex Structures:

Optimization on Low Rank Nonconvex Structures Hiroshi Konno, Phan Thien Thach, Hoang Tuy, 2013-12-01 Global optimization is one of the fastest developing fields in mathematical optimization. In fact, an increasing number of remarkably efficient deterministic algorithms have been proposed in the last ten years for solving several classes of large scale specially structured problems encountered in such areas as chemical engineering, financial engineering, location and network optimization, production and inventory control, engineering design, computational geometry, and multi objective and multi level optimization. These new developments motivated the authors to write a new book devoted to global optimization problems with special structures. Most of these problems, though highly nonconvex, can be characterized by the property that they reduce to convex minimization problems when some of the variables are fixed. A number of recently developed algorithms have been proved surprisingly efficient for handling typical classes of problems exhibiting such structures, namely low rank nonconvex structures. Audience: The book will serve as a fundamental reference book for all those who are interested in mathematical optimization. *From Convexity to Nonconvexity* R.P. Gilbert, Panagiotis D. Panagiotopoulos, Panos M. Pardalos, 2013-12-01 This collection of papers is dedicated to the memory of Gaetano Fichera, a great mathematician and also a good friend to the editors. Regrettably, it took an unusual amount of time to bring this collection out. This was primarily due to the fact that the main editor, who had collected all of the materials for this volume, P. D. Panagiotopoulos, died unexpectedly during the period when we were editing the manuscript. The other two editors, in appreciation of Panagiotopoulos' contribution to this field, believe it is therefore fitting that this collection be dedicated to his memory also. The theme of the collection is centered around the seminal research of G. Fichera on the Signorini problem. Variants on this idea enter in different ways. For example, by bringing in friction, the problem is no longer self adjoint and the minimization formulation is not valid. A large portion of this collection is devoted to survey papers concerning hemivariational methods, with a main point of its application to nonsmooth mechanics. Hemivariational inequalities, which are a generalization of variational inequalities, were pioneered by Panagiotopoulos. There are many applications of this theory to the study of non convex energy functionals occurring in many branches of mechanics. An area of concentration concerns contact problems, in particular quasistatic and dynamic contact problems with friction and damage. Nonsmooth optimization methods, which may be divided into the main groups of subgradient methods and bundle methods, are also discussed in this collection. Advancement in Business Analytics Tools for Higher Financial Performance Gharoie Ahangar, Reza, Napier, Mark, 2023-08-08 The relentless growth of data in financial markets has boosted the demand for more advanced analytical tools to facilitate and improve financial planning. The ability to constructively use this data is limited for managers and investors without the proper theoretical support. Within this context, there is an unmet demand for combining analytical finance methods with business analytics topics to inform better investment decisions. Advancement in Business Analytics Tools for Higher Financial Performance

explores the financial applications of business analytics tools that can help financial managers and investors to better understand financial theory and improve institutional investment practices This book explores the value extraction process using more accurate financial data via business analytical tools to help investors and portfolio managers develop more modern financial planning processes Covering topics such as financial markets investment analysis and statistical tools this book is ideal for accountants data analysts researchers students business professionals academicians and more

Topological Methods in Complementarity Theory G. Isac, 2000-03-31 Complementarity theory is a new domain in applied mathematics and is concerned with the study of complementarity problems These problems represent a wide class of mathematical models related to optimization game theory economic engineering mechanics fluid mechanics stochastic optimal control etc The book is dedicated to the study of nonlinear complementarity problems by topological methods Audience Mathematicians engineers economists specialists working in operations research and anybody interested in applied mathematics or in mathematical modeling *Variational and Non-variational Methods in Nonlinear Analysis and Boundary Value Problems* Dumitru Motreanu, Vicentiu D. Radulescu, 2013-06-29 This book reflects a significant part of authors research activity during the last ten years The present monograph is constructed on the results obtained by the authors through their direct cooperation or due to the authors separately or in cooperation with other mathematicians All these results fit in a unitary scheme giving the structure of this work The book is mainly addressed to researchers and scholars in Pure and Applied Mathematics Mechanics Physics and Engineering We are greatly indebted to Viorica Venera Motreanu for the careful reading of the manuscript and helpful comments on important issues We are also grateful to our Editors of Kluwer Academic Publishers for their professional assistance Our deepest thanks go to our numerous scientific collaborators and friends whose work was so important for us D Motreanu and V Radulescu IX Introduction The present monograph is based on original results obtained by the authors in the last decade This book provides a comprehensive exposition of some modern topics in nonlinear analysis with applications to the study of several classes of boundary value problems Our framework includes multivalued elliptic problems with discontinuities variational inequalities hemivariational inequalities and evolution problems The treatment relies on variational methods monotonicity principles topological arguments and optimization techniques Excepting Sections 1 and 3 in Chapter 1 and Sections 1 and 3 in Chapter 2 the material is new in comparison with any other book representing research topics where the authors contributed The outline of our work is the following **Ultra-Dense Networks** Haijun Zhang, Jemin Lee, Tony Q. S. Quek, Chih-Lin I, 2020-11-26 Understand the theory key technologies and applications of UDNs with this authoritative survey Vector Variational Inequalities and Vector Equilibria F. Giannessi, 1999-12-31 The book deals with the mathematical theory of vector variational inequalities with special reference to equilibrium problems Such models have been introduced recently to study new problems from mechanics structural engineering networks and industrial management and to revisit old ones The common feature of these problems is that given

by the presence of concurrent objectives and by the difficulty of identifying a global functional like energy to be extremized. The vector variational inequalities have the advantage of both the variational ones and vector optimization which are found as special cases. Among several applications the equilibrium flows on a network receive special attention. Audience: The book is addressed to academic researchers as well as industrial ones in the fields of mathematics, engineering, mathematical programming, control theory, operations research, computer science, and economics.

Compressive Imaging: Structure, Sampling, Learning Ben Adcock, Anders C. Hansen, 2021-09-16

Accurate robust and fast image reconstruction is a critical task in many scientific, industrial, and medical applications. Over the last decade, image reconstruction has been revolutionized by the rise of compressive imaging. It has fundamentally changed the way modern image reconstruction is performed. This in-depth treatment of the subject commences with a practical introduction to compressive imaging, supplemented with examples and downloadable code intended for readers without extensive background in the subject. Next, it introduces core topics in compressive imaging, including compressed sensing, wavelets, and optimization, in a concise yet rigorous way, before providing a detailed treatment of the mathematics of compressive imaging. The final part is devoted to recent trends in compressive imaging, deep learning, and neural networks. With an eye to the next decade of imaging research and using both empirical and mathematical insights, it examines the potential benefits and the pitfalls of these latest approaches.
