modeling discussing topics such as indoor propagation outdoor propagation etc Part III explores system performance and applications e g MIMO Over the air testing electromagnetic safety etc

**On the Design of Next-generation Wireless Networks** Wei Wang, 2010 Wireless technology has gained great attention from both academia and industry in the past decades It is believed to be the essential part to achieve the ultimate goal of communications communication happens whenever wherever and to whomever With the proliferation of different wireless technologies and their vast deployment we will soon enter the age of ubiquitous computing Compared to its wireline counterpart wireless network faces more technical challenges The wireless channel is less reliable and more variable than fibers and cables Wireless devices are usually mobile and energy constraint Wireless transceiver has limited coverage area All these characteristics make the resource allocation and algorithm design in wireless networks challenging tasks This dissertation investigates both issues in different types of next generation wireless networks This dissertation first explores the problem of providing a traffic oblivious routing and scheduling for wireless mesh networks We present an optimization model which generates a static routing and scheduling policy with worst case performance guarantees under a range of traffic conditions Packet level simulations demonstrate good average performance for the generated routing and scheduling in addition to its worse case guarantees Next we investigate the problem of identifying the maximum capacity of multi channel multi radio wireless networks given the number of available channels We provide an Integer Linear Program ILP framework to compute the maximum capacity We also discuss how to extend the framework to consider heterogeneous network Then the framework will output the minimum number of radios necessary for each node to fully utilize the available channels which can be used to identify the bottleneck in the topology and also indicates the goodness of the topology We also study the integration gain of heterogeneous WiFi and WiMAX networks We propose a generic framework to identify the integration gain the gain comes from better utilization of resources rather than the addition of resources For the performance objective we focus on the max min throughput fairness and also briefly cover the proportional fairness We propose approximation algorithms to achieve different objectives and compute the integration gain based on the framework The proposed framework can be used to evaluate the potential benefit of combining different heterogeneous wireless networks The approximation algorithms can be directly used to perform intelligent user association in the integrated network Last we study the unique characteristics of cognitive radio networks Based on our observations we propose distributed algorithms to perform channel allocation among secondary users We consider both throughput and fairness and study their tradeoff This dissertation makes important contributions by introducing novel models algorithms and architectures that will help improve the network analysis planning and deployment of next generation wireless networks
